5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. side = Nag_LeftSide
 B is pre-multiplied from the left.
side = Nag_RightSide
 B is post-multiplied from the right.

On entry: the Hermitian matrix A ; A is m by m if **side** = Nag_LeftSide, or n by n if **side** = Nag_RightSide.
 If **order** = Nag_ColMajor, A_{ij} is stored in **a**[($j - 1$) \times **pda** + $i - 1$].
 If **order** = Nag_RowMajor, A_{ij} is stored in **a**[($i - 1$) \times **pda** + $j - 1$].
 If **uplo** = Nag_Upper, the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.
 If **uplo** = Nag_Lower, the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.
- 8: **pda** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **a**.
Constraints:
 if **side** = Nag_LeftSide, **pda** \geq $\max(1, \mathbf{m})$;

 $\max(1, \mathbf{m} \times \mathbf{pdb})$ when **order** = Nag_RowMajor.
 If **order** = Nag_ColMajor, B_{ij} is stored in **b**[($j - 1$) \times **pdb** + $i - 1$].
