

## NAG Library Function Document

### nag\_prob\_beta\_vector (g01sec)

#### 1 Purpose

nag\_prob\_beta\_vector (g01sec) computes a number of lower or upper tail probabilities for the beta distribution.

#### 2 Specification

```
#include <nag.h>
#include <nagg01.h>

void nag_prob_beta_vector (Integer ltail, const Nag_TailProbability tail[],
    Integer lbeta, const double beta[], Integer la, const double a[],
    Integer lb, const double b[], double p[], Integer ivalid[],
    NagError *fail)
```

#### 3 Description

The lower tail probability,  $P(B_i \leq \beta_i : a_i, b_i)$  is defined by

$$P(B_i \leq \beta_i : a_i, b_i) = \frac{\Gamma(a_i + b_i)}{\Gamma(a_i)\Gamma(b_i)} \int_0^{\beta_i} B_i^{a_i-1} (1 - B_i)^{b_i-1} dB_i = I_{\beta_i}(a_i, b_i), \quad 0 \leq \beta_i \leq 1; \quad a_i, b_i > 0.$$

The function  $I_{\beta_i}(a_i, b_i)$ , also known as the incomplete beta function is calculated using nag\_incomplete\_beta (s14ccc).

The input arrays to this function are designed to allow maximum flexibility in the supply of vector arguments by re-using elements of any arrays that are shorter than the total number of evaluations required. See Section 2.6 in the g01 Chapter Introduction for further information.

#### 5 Arguments

1: **ltail** – Integer Input

*On entry:* the length of the array **tail**.

*Constraint:* **ltail** > 0.

2: **tail[ltail]** – const Nag\_TailProbability Input

*On entry:* indicates whether a lower or upper tail probabilities are required. For  $j = (i - 1) \bmod \mathbf{ltail}$ , for  $i = 1, 2, \dots, \max(\mathbf{ltail}, \mathbf{lbeta}, \mathbf{la}, \mathbf{lb})$ :

**tail[j]** = Nag\_LowerTail

The lower tail probability is returned, i.e.,  $p_i = P(B_i \leq \beta_i : a_i, b_i)$ .

**tail**[*j*] = Nag\_UpperTail

The upper tail probability is returned, i.e.,  $p_i = P(B_i \geq \beta_i : a_i, b_i)$ .

*Constraint:* **tail**[*j* - 1] = Nag\_LowerTail or Nag\_UpperTail, for  $j = 1, 2, \dots, \mathbf{ltail}$ .

- 3: **lbeta** – Integer *Input*  
*On entry:* the length of the array **beta**.  
*Constraint:* **lbeta** > 0.
- 4: **beta**[**lbeta**] – const double *Input*  
*On entry:*  $\beta_i$ , the value of the beta variate with  $\beta_i = \mathbf{beta}[j]$ ,  $j = (i - 1) \bmod \mathbf{lbeta}$ .  
*Constraint:*  $0.0 \leq \mathbf{beta}[j - 1] \leq 1.0$ , for  $j = 1, 2, \dots, \mathbf{lbeta}$ .
- 5: **la** – Integer *Input*  
*On entry:* the length of the array **a**.  
*Constraint:* **la** > 0.
- 6: **a**[**la**] – const double *Input*  
*On entry:*  $a_i$ , the first parameter of the required beta distribution with  $a_i = \mathbf{a}[j]$ ,  $j = (i - 1) \bmod \mathbf{la}$ .  
*Constraint:*  $\mathbf{a}[j - 1] > 0.0$ , for  $j = 1, 2, \dots, \mathbf{la}$ .
- 7: **lb** – Integer *Input*  
*On entry:* the length of the array **b**.  
*Constraint:* **lb** > 0.
- 8: **b**[**lb**] – const double *Input*  
*On entry:*  $b_i$ , the second parameter of the required beta distribution with  $b_i = \mathbf{b}[j]$ ,  $j = (i - 1) \bmod \mathbf{lb}$ .  
*Constraint:*  $\mathbf{b}[j - 1] > 0.0$ , for  $j = 1, 2, \dots, \mathbf{lb}$ .
- 9: **p**[*dim*] – double *Output*  
**Note:** the dimension, *dim*, of the array **p** must be at least  $\max(\mathbf{ltail}, \mathbf{lbeta}, \mathbf{la}, \mathbf{lb})$ .  
*On exit:*  $p_i$ , the probabilities for the beta distribution.
- 10: **ivalid**[*dim*] – Integer *Output*  
**Note:** the dimension, *dim*, of the array **ivalid** must be at least  $\max(\mathbf{ltail}, \mathbf{lbeta}, \mathbf{la}, \mathbf{lb})$ .  
*On exit:* **ivalid**[*i* - 1] indicates any errors with the input arguments, with  
**ivalid**[*i* - 1] = 0  
 No error.  
**ivalid**[*i* - 1] = 1  
 On entry, invalid value supplied in **tail** when calculating  $p_i$ .  
**ivalid**[*i* - 1] = 2  
 On entry,  $\beta_i < 0.0$ ,  
 or  $\beta_i > 1.0$ .

**ivalid**[ $i - 1$ ] = 3

On entry,  $a_i \leq 0.0$ ,  
or  $b_i \leq 0.0$ ,

11: **fail** – NagError \*

*Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

### NE\_ARRAY\_SIZE

On entry, array size =  $\langle value \rangle$ .

Constraint: **la** > 0.

On entry, array size =  $\langle value \rangle$ .

Constraint: **lb** > 0.

On entry, array size =  $\langle value \rangle$ .

Constraint: **lbeta** > 0.

On entry, array size =  $\langle value \rangle$ .

Constraint: **ltail** > 0.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

### NW\_INVALID

On entry, at least one value of **beta**, **a**, **b** or **tail** was invalid.

Check **ivalid** for more information.

## 7 Accuracy

The accuracy is limited by the error in the incomplete beta function. See Section 7 in `nag_incomplete_beta` (s14ccc) for further details.

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

None.

## 10 Example

This example reads values from a number of beta distributions and computes the associated lower tail probabilities.
