NAG Library Function Document nag_1_sample_ks_test (g08cbc)

1 Purpose

nag_1_sample_ks_test (g08cbc) performs the one sample Kolmogorov-Smirnov test, using one of the distributions provided.

2 Specification

```
#include <nag.h>
#include <nagg08.h>

void nag_1_sample_ks_test (Integer n, const double x[],
    Nag_Distributions dist, double par[], Nag_ParaEstimates estima,
    Nag_TestStatistics ntype, double *d, double *z, double *p,
    NagError *fail)
```

3 Description

The data consist of a single sample of n observations denoted by x_1, x_2, \ldots, x_n . Let $S_n(x_{(i)})$ and $F_0(x_{(i)})$ represent the sample cumulative distribution function and the theoretical (null) cumulative distribution function respectively at the point $x_{(i)}$ where $x_{(i)}$ is the *i*th smallest sample observation.

The Kolmogorov–Smirnov test provides a test of the null hypothesis H_0 : the data are a random sample of observations from a theoretical distribution specified by you against one of the following alternative hypotheses:

- (i) H_1 : the data cannot be considered to be a random sample from the specified null distribution.
- (ii) H_2 : the data arise from a distribution which dominates the specified null distribution. In practical terms, this would be demonstrated if the values of the sample cumulative distribution function $S_n(x)$ tended to exceed the corresponding values of the theoretical cumulative distribution function $F_0(x)$.
- (iii) H_3 : the data arise from a distribution which is dominated by the specified null distribution. In practical terms, this would be demonstrated if the values of the theoretical cumulative distribution function $F_0(x)$ tended to exceed the corresponding values of the sample cumulative distribution function $S_n(x)$.

One of the following test statistics is computed depending on the particular alternative null hypothesis specified (see the description of the argument **ntype** in Section 5).

For the alternative hypothesis H_1 .

 D_n – the largest absolute deviation between the sample cumulative distribution function and the theoretical cumulative distribution function. Formally $D_n = \max\{D_n^+, D_n^-\}$.

For the alternative hypothesis H_2 .

 D_n^+ – the largest positive deviation between the sample cumulative distribution function and the theoretical cumulative distribution function. Formally $D_n^+ = \max\{S_n(x_{(i)}) - F_0(x_{(i)}), 0\}$ for both discrete and continuous null distributions.

For the alternative hypothesis H_3 .

 D_n^- - the largest positive deviation between the theoretical cumulative distribution function and the sample cumulative distribution function. Formally if the null distribution is discrete then $D_n^- = \max\{F_0(x_{(i)}) - S_n(x_{(i)}), 0\}$ and if the null distribution is continuous then $D_n^- = \max\{F_0(x_{(i)}) - S_n(x_{(i-1)}), 0\}$.

g08cbc NAG Library Manual

The standardized statistic $Z = D \times \sqrt{n}$ is also computed where D may be D_n , D_n^+ or D_n^- depending on the choice of the alternative hypothesis. This is the standardized value of D with no correction for continuity applied and the distribution of Z converges asymptotically to a limiting distribution, first derived by Kolmogorov (1933), and then tabulated by Smirnov (1948). The asymptotic distributions for the one-sided statistics were obtained by Smirnov (1933).

The probability, under the null hypothesis, of obtaining a value of the test statistic as extreme as that observed, is computed. If $n \le 100$ an exact method given by Conover (1980), is used. Note that the method used is only exact for continuous theoretical distributions and does not include Conover's modification for discrete distributions. This method computes the one-sided probabilities. The two-sided probabilities are estimated by doubling the one-sided probability. This is a good estimate for small p, that is $p \le 0.10$, but it becomes very poor for larger p. If n > 100 then p is computed using the Kolmogorov–Smirnov limiting distributions, see Feller (1948), Kendall and Stuart (1973), Kolmogorov (1933), Smirnov (1933) and Smirnov (1948).

5 Arguments

1: **n** – Integer Input

On entry: n, the number of observations in the sample.

Constraint: $\mathbf{n} \geq 3$.

2: $\mathbf{x}[\mathbf{n}]$ - const double

Input

On entry: the sample observations x_1, x_2, \ldots, x_n .

Constraint: the sample observations supplied must be consistent, in the usual manner, with the null distribution chosen, as specified by the arguments **dist** and **par**. For further details see Section 9.

3: **dist** – Nag_Distributions

Input

On entry: the theoretical (null) distribution from which it is suspected the data may arise.

dist = Nag_Uniform

The uniform distribution over (a, b).

dist = Nag_Normal

The Normal distribution with mean μ and variance σ^2 .

dist = Nag_Gamma

The gamma distribution with shape parameter α and scale parameter β , where the mean $= \alpha \beta$.

g08cbc.2 Mark 25

 $dist = Nag_Beta$

The beta distribution with shape parameters α and β , where the mean $= \alpha/(\alpha + \beta)$.

dist = Nag_Binomial

The binomial distribution with the number of trials, m, and the probability of a success, p.

dist = Nag_Exponential

The exponential distribution with parameter λ , where the mean = $1/\lambda$.

dist = Nag_Poisson

The Poisson distribution with parameter μ , where the mean $= \mu$.

dist = Nag_NegBinomial

The negative binomial distribution with the number of trials, m, and the probability of success, p.

dist = Nag_GenPareto

The generalized Pareto distribution with shape parameter ξ and scale β .

Constraint: **dist** = Nag_Uniform, Nag_Normal, Nag_Gamma, Nag_Beta, Nag_Binomial, Nag_Exponential, Nag_Poisson, Nag_NegBinomial or Nag_GenPareto.

4: par[2] - double Input/Output

On entry: if **estima** = Nag_ParaSupplied, **par** must contain the known values of the parameter(s) of the null distribution as follows.

If a uniform distribution is used, then par[0] and par[1] must contain the boundaries a and b respectively.

If a Normal distribution is used, then par[0] and par[1] must contain the mean, μ , and the variance, σ^2 , respectively.

If a gamma distribution is used, then $\mathbf{par}[0]$ and $\mathbf{par}[1]$ must contain the parameters α and β respectively.

If a beta distribution is used, then $\mathbf{par}[0]$ and $\mathbf{par}[1]$ must contain the parameters α and β respectively.

If a binomial distribution is used, then par[0] and par[1] must contain the parameters m and p respectively.

If an exponential distribution is used, then par[0] must contain the parameter λ .

If a Poisson distribution is used, then par[0] must contain the parameter μ .

If a negative binomial distribution is used, $\mathbf{par}[0]$ and $\mathbf{par}[1]$ must contain the parameters m and p respectively.

If a generalized Pareto distribution is used, par[0] and par[1] must contain the parameters ξ and β respectively.

If **estima** = Nag_ParaEstimated, **par** need not be set except when the null distribution requested is either the binomial or the negative binomial distribution in which case par[0] must contain the parameter m.

On exit: if $estima = Nag_ParaSupplied$, par is unchanged; if $estima = Nag_ParaEstimated$, and $dist = Nag_Binomial$ or $dist = Nag_NegBinomial$ then par[1] is estimated from the data; otherwise par[0] and par[1] are estimated from the data.

Constraints:

```
if dist = Nag_Uniform, par[0] < par[1];
if dist = Nag_Normal, par[1] > 0.0;
if dist = Nag_Gamma, par[0] > 0.0 and par[1] > 0.0;
if dist = Nag_Beta, par[0] > 0.0 and par[1] > 0.0 and par[0] \leq 10^6 and par[1] \leq 10^6;
```

g08cbc NAG Library Manual

```
if \mathbf{dist} = \mathrm{Nag\_Binomial}, \mathbf{par}[0] \geq 1.0 and 0.0 < \mathbf{par}[1] < 1.0 and \mathbf{par}[0] \times \mathbf{par}[1] \times (1.0 - \mathbf{par}[1]) \leq 10^6 and \mathbf{par}[0] < 1/\mathrm{eps}, where \mathrm{eps} = \mathbf{machine\ precision}, see \mathrm{nag\_machine\_precision} (X02AJC); if \mathbf{dist} = \mathrm{Nag\_Exponential}, \mathbf{par}[0] > 0.0; if \mathbf{dist} = \mathrm{Nag\_Poisson}, \mathbf{par}[0] > 0.0 and \mathbf{par}[0] \leq 10^6; if \mathbf{dist} = \mathrm{Nag\_NegBinomial}, \mathbf{par}[0] \geq 1.0 and 0.0 < \mathbf{par}[1] < 1.0 and \mathbf{par}[0] \times (1.0 - \mathbf{par}[1])/(\mathbf{par}[1] \times \mathbf{par}[1]) \leq 10^6 and \mathbf{par}[0] < 1/\mathrm{eps}, where \mathrm{eps} = \mathbf{machine\ precision}, see \mathrm{nag\_machine\_precision} (X02AJC); if \mathbf{dist} = \mathrm{Nag\_GenPareto}, \mathbf{par}[1] > 0.
```

5: **estima** – Nag ParaEstimates

Input

On entry: **estima** must specify whether values of the parameters of the null distribution are known or are to be estimated from the data.

estima = Nag_ParaSupplied

Values of the parameters will be supplied in the array par described above.

estima = Nag_ParaEstimated

Parameters are to be estimated from the data except when the null distribution requested is the binomial distribution or the negative binomial distribution in which case the first parameter, m, must be supplied in $\mathbf{par}[0]$ and only the second parameter, p, is estimated from the data.

Constraint: estima = Nag_ParaSupplied or Nag_ParaEstimated.

6: **ntype** – Nag_TestStatistics

Input

On entry: the test statistic to be calculated, i.e., the choice of alternative hypothesis.

ntvpe = Nag_TestStatisticsDAbs

Computes D_n , to test H_0 against H_1 ,

 $ntype = Nag_TestStatisticsDPos$

Computes D_n^+ , to test H_0 against H_2 ,

ntype = Nag_TestStatisticsDNeg

Computes D_n^- , to test H_0 against H_3 .

 $\textit{Constraint}: \ \textbf{ntype} = \text{Nag_TestStatisticsDAbs}, \ \text{Nag_TestStatisticsDPos} \ \ \text{or} \ \ \text{Nag_TestStatisticsDNeg}.$

7: **d** – double *

On exit: the Kolmogorov-Smirnov test statistic (D_n, D_n^+) or D_n^- according to the value of **ntype**).

8: \mathbf{z} - double * Output

On exit: a standardized value, Z, of the test statistic, D, without any correction for continuity.

9: **p** – double *

On exit: the probability, p, associated with the observed value of D where D may be D_n , D_n^+ or D_n^- depending on the value of **ntype** (see Section 3).

10: **fail** – NagError * Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

g08cbc.4 Mark 25

NE BAD PARAM

On entry, argument \(\value \rangle \) had an illegal value.

NE G08CB DATA

```
On entry, dist = Nag\_Beta and at least one observation is illegal.
```

Constraint: $0 \le \mathbf{x}[i-1] \le 1$, for $i = 1, 2, \dots, \mathbf{n}$.

On entry, dist = NagBinomial and all observations are zero or m.

Constraint: at least one $0.0 < \mathbf{x}[i-1] < \mathbf{par}[0]$, for $i = 1, 2, ..., \mathbf{n}$.

On entry, **dist** = Nag_Binomial and at least one observation is illegal.

Constraint: $0 \le \mathbf{x}[i-1] \le \mathbf{par}[0]$, for $i = 1, 2, ..., \mathbf{n}$.

On entry, **dist** = Nag_Exponential or Nag_Poisson and all observations are zero.

Constraint: at least one $\mathbf{x}[i-1] > 0$, for $i = 1, 2, ..., \mathbf{n}$.

On entry, dist = Nag_Gamma, Nag_Exponential, Nag_Poisson, Nag_NegBinomial or

Nag_GenPareto and at least one observation is negative.

Constraint: $\mathbf{x}[i-1] \ge 0$, for $i = 1, 2, ..., \mathbf{n}$.

On entry, $dist = Nag_Uniform$ and at least one observation is illegal.

Constraint: $par[0] \le x[i-1] \le par[1]$, for i = 1, 2, ..., n.

NE G08CB PARAM

On entry, **dist** = Nag_Binomial and $m = par[0] = \langle value \rangle$.

Note that m must always be supplied.

Constraint: for the binomial distribution, $1 \le par[0] < 1/eps$, where eps = *machine precision*, see nag machine precision (X02AJC).

On entry, **dist** = Nag_GenPareto and **estima** = Nag_ParaEstimated.

The parameter estimates are invalid; the data may not be from the generalized Pareto distribution.

On entry, **dist** = Nag_NegBinomial and $m = par[0] = \langle value \rangle$.

Note that m must always be supplied.

Constraint: for the negative binomial distribution, $1 \le par[0] < 1/eps$, where eps = *machine precision*, see nag machine precision (X02AJC).

On entry, estima = Nag_ParaSupplied and $par[0] = \langle value \rangle$; $par[1] = \langle value \rangle$.

Constraint: for the beta distribution, 0 < par[0] and $par[1] \le 1000000$.

On entry, **estima** = Nag_ParaSupplied and $par[0] = \langle value \rangle$; $par[1] = \langle value \rangle$.

Constraint: for the gamma distribution, par[0] and par[1] > 0.

On entry, **estima** = Nag_ParaSupplied and $par[0] = \langle value \rangle$; $par[1] = \langle value \rangle$.

Constraint: for the generalized Pareto distribution with $\mathbf{par}[0] < 0$, $0 \le \mathbf{x}[i-1] \le -\mathbf{par}[1]/\mathbf{par}[0]$, for $i = 1, 2, ..., \mathbf{n}$.

On entry, estima = Nag_ParaSupplied and $par[0] = \langle value \rangle$; $par[1] = \langle value \rangle$.

Constraint: for the uniform distribution, par[0] < par[1].

On entry, **estima** = Nag_ParaSupplied and $par[0] = \langle value \rangle$.

Constraint: for the exponential distribution, par[0] > 0.

On entry, **estima** = Nag_ParaSupplied and $par[0] = \langle value \rangle$.

Constraint: for the Poisson distribution, 0 < par[0] < 1000000.

On entry, **estima** = Nag_ParaSupplied and **par**[1] = $\langle value \rangle$.

Constraint: for the binomial distribution, 0 < par[1] < 1.

On entry, **estima** = Nag_ParaSupplied and $par[1] = \langle value \rangle$.

Constraint: for the generalized Pareto distribution, par[1] > 0.

On entry, **estima** = Nag_ParaSupplied and $par[1] = \langle value \rangle$.

Constraint: for the negative binomial distribution, 0 < par[1] < 1.

g08cbc NAG Library Manual

```
On entry, estima = Nag_ParaSupplied and par[1] = \langle value \rangle. Constraint: for the Normal distribution, par[1] > 0.
```

NE_G08CB_SAMPLE

On entry, **dist** = Nag_Uniform, Nag_Normal, Nag_Gamma, Nag_Beta or Nag_GenPareto, **estima** = Nag_ParaEstimated and the whole sample is constant. Thus the variance is zero.

NE G08CB VARIANCE

```
On entry, dist = Nag_Binomial, \mathbf{par}[0] = \langle value \rangle, \mathbf{par}[1] = \langle value \rangle. The variance \mathbf{par}[0] \times \mathbf{par}[1] \times (1 - \mathbf{par}[1]) exceeds 1000000. On entry, dist = Nag_NegBinomial, \mathbf{par}[0] = \langle value \rangle, \mathbf{par}[1] = \langle value \rangle. The variance \mathbf{par}[0] \times (1 - \mathbf{par}[1])/(\mathbf{par}[1] \times \mathbf{par}[1]) exceeds 1000000.
```

NE_INT_ARG_LT

```
On entry, \mathbf{n} = \langle value \rangle. Constraint: \mathbf{n} \geq 3.
```

$NE_INTERNAL_ERROR$

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

NE NO LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

The approximation for p, given when n > 100, has a relative error of at most 2.5% for most cases. The two-sided probability is approximated by doubling the one-sided probability. This is only good for small p, i.e., p < 0.10 but very poor for large p. The error is always on the conservative side, that is the tail probability, p, is over estimated.

8 Parallelism and Performance

nag_1_sample_ks_test (g08cbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The time taken by $nag_1_sample_ks_test$ (g08cbc) increases with n until n > 100 at which point it drops and then increases slowly with n. The time may also depend on the choice of null distribution and on whether or not the parameters are to be estimated.

The data supplied in the argument x must be consistent with the chosen null distribution as follows:

```
when dist = Nag_Uniform, then par[0] \le x_i \le par[1], for i = 1, 2, ..., n; when dist = Nag_Normal, then there are no constraints on the x_i's; when dist = Nag_Gamma, then x_i \ge 0.0, for i = 1, 2, ..., n;
```

g08cbc.6 Mark 25

```
when \mathbf{dist} = \mathrm{Nag\_Beta}, then 0.0 \le x_i \le 1.0, for i = 1, 2, \ldots, n; when \mathbf{dist} = \mathrm{Nag\_Binomial}, then 0.0 \le x_i \le \mathbf{par}[0], for i = 1, 2, \ldots, n; when \mathbf{dist} = \mathrm{Nag\_Exponential}, then x_i \ge 0.0, for i = 1, 2, \ldots, n; when \mathbf{dist} = \mathrm{Nag\_Poisson}, then x_i \ge 0.0, for i = 1, 2, \ldots, n; when \mathbf{dist} = \mathrm{Nag\_NegBinomial}, then x_i \ge 0.0, for i = 1, 2, \ldots, n; when \mathbf{dist} = \mathrm{Nag\_GenPareto} and \mathbf{par}[0] \ge 0.0, then x_i \ge 0.0, for i = 1, 2, \ldots, n; when \mathbf{dist} = \mathrm{Nag\_GenPareto} and \mathbf{par}[0] < 0.0, then 0.0 \le x_i \le -\mathbf{par}[1]/\mathbf{par}[0], for i = 1, 2, \ldots, n.
```

10 Example

The following example program reads in a set of data consisting of 30 observations. The Kolmogorov–Smirnov test is then applied twice, firstly to test whether the sample is taken from a uniform distribution, U(0,2), and secondly to test whether the sample is taken from a Normal distribution where the mean and variance are estimated from the data. In both cases we are testing against H_1 ; that is, we are doing a two tailed test. The values of \mathbf{d} , \mathbf{z} and \mathbf{p} are printed for each case.
