# NAG Library Function Document nag\_complex\_bessel\_j (s17dec)

## 1 Purpose

nag\_complex\_bessel\_j (s17dec) returns a sequence of values for the Bessel functions  $J_{\nu+n}(z)$  for complex z, non-negative  $\nu$  and  $n=0,1,\ldots,N-1$ , with an option for exponential scaling.

## 2 Specification

## 3 Description

nag\_complex\_bessel\_j (s17dec) evaluates a sequence of values for the Bessel function  $J_{\nu}(z)$ , where z is complex,  $-\pi < \arg z \le \pi$ , and  $\nu$  is the real, non-negative order. The N-member sequence is generated for orders  $\nu$ ,  $\nu+1,\ldots,\nu+N-1$ . Optionally, the sequence is scaled by the factor  $e^{-|\operatorname{Im}(z)|}$ .

**Note:** although the function may not be called with  $\nu$  less than zero, for negative orders the formula  $J_{-\nu}(z) = J_{\nu}(z)\cos(\pi\nu) - Y_{\nu}(z)\sin(\pi\nu)$  may be used (for the Bessel function  $Y_{\nu}(z)$ , see nag complex bessel y (s17dcc)).

The function is derived from the function CBESJ in Amos (1986). It is based on the relations  $J_{\nu}(z)=e^{\nu\pi i/2}I_{\nu}(-iz)$ ,  ${\rm Im}(z)\geq 0.0$ , and  $J_{\nu}(z)=e^{-\nu\pi i/2}I_{\nu}(iz)$ ,  ${\rm Im}(z)<0.0$ .

The Bessel function  $I_{\nu}(z)$  is computed using a variety of techniques depending on the region under consideration.

When N is greater than 1, extra values of  $J_{\nu}(z)$  are computed using recurrence relations.

For very large |z| or  $(\nu+N-1)$ , argument reduction will cause total loss of accuracy, and so no computation is performed. For slightly smaller |z| or  $(\nu+N-1)$ , the computation is performed but results are accurate to less than half of *machine precision*. If  $\mathrm{Im}(z)$  is large, there is a risk of overflow and so no computation is performed. In all the above cases, a warning is given by the function.

# 5 Arguments

1:  $\mathbf{fnu}$  – double Input

On entry:  $\nu$ , the order of the first member of the sequence of functions.

Constraint:  $\mathbf{fnu} \geq 0.0$ .

2: **z** – Complex Input

On entry: the argument z of the functions.

Mark 25 s17dec.1

s17dec NAG Library Manual

3:  $\mathbf{n}$  - Integer Input

On entry: N, the number of members required in the sequence  $J_{\nu}(z), J_{\nu+1}(z), \dots, J_{\nu+N-1}(z)$ . Constraint:  $\mathbf{n} \geq 1$ .

## 4: **scal** – Nag\_ScaleResType

Input

On entry: the scaling option.

scal = Nag\_UnscaleRes

The results are returned unscaled.

scal = Nag\_ScaleRes

The results are returned scaled by the factor  $e^{-|\operatorname{Im}(z)|}$ .

Constraint: scal = Nag\_UnscaleRes or Nag\_ScaleRes.

## 5: $\mathbf{cy}[\mathbf{n}]$ – Complex

Output

On exit: the N required function values:  $\mathbf{cy}[i-1]$  contains  $J_{\nu+i-1}(z)$ , for  $i=1,2,\ldots,N$ .

6: **nz** – Integer \*

Output

On exit: the number of components of cy that are set to zero due to underflow. If nz > 0, then elements cy[n - nz], cy[n - nz + 1], ..., cy[n - 1] are set to zero.

7: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

## NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

## NE BAD PARAM

On entry, argument \( \nabla value \rangle \) had an illegal value.

#### NE INT

On entry,  $\mathbf{n} = \langle value \rangle$ . Constraint:  $\mathbf{n} > 1$ .

### NE INTERNAL ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

## NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

## NE\_OVERFLOW\_LIKELY

No computation because  $\mathbf{z}.im = \langle value \rangle > \langle value \rangle$ ,  $\mathbf{scal} = \text{Nag\_UnscaleRes}$ .

s17dec.2 Mark 25

#### **NE REAL**

```
On entry, \mathbf{fnu} = \langle value \rangle.
Constraint: \mathbf{fnu} \geq 0.0.
```

## **NE\_TERMINATION\_FAILURE**

No computation – algorithm termination condition not met.

#### **NE TOTAL PRECISION LOSS**

```
No computation because |\mathbf{z}| = \langle value \rangle > \langle value \rangle.
No computation because \mathbf{fnu} + \mathbf{n} - 1 = \langle value \rangle > \langle value \rangle.
```

## NW SOME PRECISION LOSS

```
Results lack precision because |\mathbf{z}| = \langle value \rangle > \langle value \rangle.
Results lack precision because \mathbf{fnu} + \mathbf{n} - 1 = \langle value \rangle > \langle value \rangle.
```

## 7 Accuracy

All constants in nag\_complex\_bessel\_j (s17dec) are given to approximately 18 digits of precision. Calling the number of digits of precision in the floating-point arithmetic being used t, then clearly the maximum number of correct digits in the results obtained is limited by  $p = \min(t, 18)$ . Because of errors in argument reduction when computing elementary functions inside nag\_complex\_bessel\_j (s17dec), the actual number of correct digits is limited, in general, by p-s, where  $s \approx \max(1, |\log_{10} z|, |\log_{10} \nu|)$  represents the number of digits lost due to the argument reduction. Thus the larger the values of |z| and  $\nu$ , the less the precision in the result. If nag\_complex\_bessel\_j (s17dec) is called with n>1, then computation of function values via recurrence may lead to some further small loss of accuracy.

If function values which should nominally be identical are computed by calls to nag\_complex\_bessel\_j (s17dec) with different base values of  $\nu$  and different  $\mathbf{n}$ , the computed values may not agree exactly. Empirical tests with modest values of  $\nu$  and z have shown that the discrepancy is limited to the least significant 3-4 digits of precision.

## 8 Parallelism and Performance

Not applicable.

#### **9** Further Comments

The time taken for a call of nag\_complex\_bessel\_j (s17dec) is approximately proportional to the value of  $\mathbf{n}$ , plus a constant. In general it is much cheaper to call nag\_complex\_bessel\_j (s17dec) with  $\mathbf{n}$  greater than 1, rather than to make N separate calls to nag complex bessel j (s17dec).

Paradoxically, for some values of z and  $\nu$ , it is cheaper to call nag\_complex\_bessel\_j (s17dec) with a larger value of  $\bf n$  than is required, and then discard the extra function values returned. However, it is not possible to state the precise circumstances in which this is likely to occur. It is due to the fact that the base value used to start recurrence may be calculated in different regions for different  $\bf n$ , and the costs in each region may differ greatly.

Note that if the function required is  $J_0(x)$  or  $J_1(x)$ , i.e.,  $\nu=0.0$  or 1.0, where x is real and positive, and only a single unscaled function value is required, then it may be much cheaper to call nag\_bessel\_j0 (s17aec) or nag\_bessel\_j1 (s17afc) respectively.

## 10 Example

This example prints a caption and then proceeds to read sets of data from the input data stream. The first datum is a value for the order  $\mathbf{fnu}$ , the second is a complex value for the argument,  $\mathbf{z}$ , and the third is a character value used as a flag to set the argument  $\mathbf{scal}$ . The program calls the function with  $\mathbf{n} = 2$  to

Mark 25 s17dec.3

s17dec NAG Library Manual

evaluate the function for orders  $\mathbf{fnu}$  and  $\mathbf{fnu} + 1$ , and it prints the results. The process is repeated until the end of the input data stream is encountered.
