NAG Library Function Document

nag_kelvin_kei_vector (s19arc)

1 Purpose

nag_kelvin_kei_vector (s19arc) returns an array of values for the Kelvin function $\mathrm{kei}\, x$.

2 Specification

```
#include <nag.h>
#include <nags.h>
void nag_kelvin_kei_vector (Integer n, const double x[], double f[],
     Integer ivalid[], NagError *fail)
```

3 Description

nag_kelvin_kei_vector (s19arc) evaluates an approximation to the Kelvin function $\mathrm{kei}\, x_i$ for an array of arguments x_i, for $i = 1, 2, \ldots, n$.

Note: for $x < 0$ the function is undefined, so we need only consider $x \geq 0$.

The function is based on several Chebyshev expansions:

For $0 \leq x \leq 1$,

$$\mathrm{kei}\, x = -\frac{\pi}{4} f(t) + \frac{x^2}{4}[-g(t)\log(x) + v(t)]$$

where $f(t)$, $g(t)$ and $v(t)$ are expansions in the variable $t = 2x^4 - 1$;

For $1 < x \leq 3$,

$$\mathrm{kei}\, x = \exp\left(-\frac{9}{8}x\right) u(t)$$

where $u(t)$ is an expansion in the variable $t = x - 2$;

For $x > 3$,

$$\mathrm{kei}\, x = \sqrt{\frac{\pi}{2x}} e^{-x/\sqrt{2}} \left[\left(1 + \frac{1}{x}\right) c(t) \sin\beta + \frac{1}{x} d(t) \cos\beta\right]$$

where $\beta = \dfrac{x}{\sqrt{2}} + \dfrac{\pi}{8}$, and $c(t)$ and $d(t)$ are expansions in the variable $t = \dfrac{6}{x} - 1$.

For $x < 0$, the function is undefined, and hence the function fails and returns zero.

When x is sufficiently close to zero, the result is computed as

$$\mathrm{kei}\, x = -\frac{\pi}{4} + \left(1 - \gamma - \log\left(\frac{x}{2}\right)\right)\frac{x^2}{4}$$

and when x is even closer to zero simply as

$$\mathrm{kei}\, x = -\frac{\pi}{4}.$$

For large x, $\mathrm{kei}\, x$ is asymptotically given by $\sqrt{\dfrac{\pi}{2x}} e^{-x/\sqrt{2}}$ and this becomes so small that it cannot be computed without underflow and the function fails.

5 Arguments

1: **n** – Integer *Input*

On entry: n, the number of points.

Constraint: $\mathbf{n} \geq 0$.

2: **x**[**n**] – const double *Input*

On entry: the argument x_i of the function, for $i = 1, 2, \ldots, \mathbf{n}$.

Constraint: $\mathbf{x}[i-1] \geq 0.0$, for $i = 1, 2, \ldots, \mathbf{n}$.

3: **f**[**n**] – double *Output*

On exit: $\mathrm{kei}\, x_i$, the function values.

4: **ivalid**[**n**] – Integer *Output*

On exit: **ivalid**$[i-1]$ contains the error code for x_i, for $i = 1, 2, \ldots, \mathbf{n}$.

ivalid$[i-1] = 0$
No error.

ivalid$[i-1] = 1$
x_i is too large, the result underflows. **f**$[i-1]$ contains zero. The threshold value is the same as for **fail.code** = NE_REAL_ARG_GT in nag_kelvin_kei (s19adc), as defined in the Users' Note for your implementation.

ivalid$[i-1] = 2$
$x_i < 0.0$, the function is undefined. **f**$[i-1]$ contains 0.0.

5: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, **n** = ⟨*value*⟩.
Constraint: $\mathbf{n} \geq 0$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

NW_IVALID

On entry, at least one value of **x** was invalid.
Check **ivalid** for more information.

7 Accuracy

Let E be the absolute error in the result, and δ be the relative error in the argument. If δ is somewhat larger than the machine representation error, then we have:

$$E \simeq \left| \frac{x}{\sqrt{2}}(-\mathrm{ker}_1\, x + \mathrm{kei}_1\, x) \right| \delta.$$

For small x, errors are attenuated by the function and hence are limited by the ***machine precision***.

For medium and large x, the error behaviour, like the function itself, is oscillatory and hence only absolute accuracy of the function can be maintained. For this range of x, the amplitude of the absolute error decays like $\sqrt{\frac{\pi x}{2}} e^{-x/\sqrt{2}}$, which implies a strong attenuation of error. Eventually, $\mathrm{kei}\, x$, which is asymptotically given by $\sqrt{\frac{\pi}{2x}} e^{-x/\sqrt{2}}$, becomes so small that it cannot be calculated without causing underflow and therefore the function returns zero. Note that for large x, the errors are dominated by those of the standard function exp.

8 Parallelism and Performance

Not applicable.

9 Further Comments

Underflow may occur for a few values of x close to the zeros of $\mathrm{kei}\, x$, below the limit which causes a failure with **fail.code** = NW_IVALID.

10 Example

This example reads values of **x** from a file, evaluates the function at each value of x_i and prints the results.
