

# NAG Library Function Document

## nag\_jumpdiff\_merton\_greeks (s30jbc)

### 1 Purpose

nag\_jumpdiff\_merton\_greeks (s30jbc) computes the European option price together with its sensitivities (Greeks) using the Merton jump-diffusion model.

### 2 Specification

```
#include <nag.h>
#include <nags.h>
void nag_jumpdiff_merton_greeks (Nag_OrderType order, Nag_CallPut option,
    Integer m, Integer n, const double x[], double s, const double t[],
    double sigma, double r, double lambda, double jvol, double p[],
    double delta[], double gamma[], double vega[], double theta[],
    double rho[], double vanna[], double charm[], double speed[],
    double colour[], double zomma[], double vomma[], NagError *fail)
```

### 3 Description

nag\_jumpdiff\_merton\_greeks (s30jbc) uses Merton's jump-diffusion model (Merton (1976)) to compute the price of a European option, together with the Greeks or sensitivities, which are the partial derivatives of the option price with respect to certain of the other input parameters. Merton's model assumes that the asset price is described by a Brownian motion with drift, as in the Black–Scholes–Merton case, together with a compound Poisson process to model the jumps. The corresponding stochastic differential equation is,

$$\frac{dS}{S} = (\alpha - \lambda k)dt + \hat{\sigma}dW_t + dq_t.$$

Here  $\alpha$  is the instantaneous expected return on the asset price,  $S$ ;  $\hat{\sigma}^2$  is the instantaneous variance of the return when the Poisson event does not occur;  $dW_t$  is a standard Brownian motion;  $q_t$  is the independent Poisson process and  $k = E[Y - 1]$  where  $Y - 1$  is the random variable change in the stock price if the Poisson event occurs and  $E$  is the expectation operator over the random variable  $Y$ .

This leads to the following price for a European option (see Haug (2007))

$$P_{\text{call}} = \sum_{j=0}^{\infty} \frac{e^{-\lambda T} (\lambda T)^j}{j!} C_j(S, X, T, r, \sigma'_j),$$

where  $T$  is the time to expiry;  $X$  is the strike price;  $r$  is the annual risk-free interest rate;  $C_j(S, X, T, r, \sigma'_j)$  is the Black–Scholes–Merton option pricing formula for a European call (see nag\_bsm\_price (s30aac)).

$$\sigma'_j = \sqrt{z^2 + \delta^2(\frac{j}{T})},$$

$$z^2 = \sigma^2 - \lambda \delta^2,$$

$$\delta^2 = \frac{\gamma \sigma^2}{\lambda},$$

where  $\sigma$  is the total volatility including jumps;  $\lambda$  is the expected number of jumps given as an average per year;  $\gamma$  is the proportion of the total volatility due to jumps.

The value of a put is obtained by substituting the Black–Scholes–Merton put price for  $C_j(S, X, T, r, \sigma'_j)$ .

The option price  $P_{ij} = P(X = X_i, T = T_j)$  is computed for each strike price in a set  $X_i$ ,  $i = 1, 2, \dots, m$ , and for each expiry time in a set  $T_j$ ,  $j = 1, 2, \dots, n$ .

## 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **option** – Nag\_CallPut *Input*

*On entry:* determines whether the option is a call or a put.

**option** = Nag\_Call

A call; the holder has a right to buy.

**option** = Nag\_Put

A put; the holder has a right to sell.

*Constraint:* **option** = Nag\_Call or Nag\_Put.

3: **m** – Integer *Input*

*On entry:* the number of strike prices to be used.

*Constraint:* **m**  $\geq 1$ .

4: **n** – Integer *Input*

*On entry:* the number of times to expiry to be used.

*Constraint:* **n**  $\geq 1$ .

5: **x[m]** – const double *Input*

*On entry:* **x**[*i* − 1] must contain  $X_i$ , the *i*th strike price, for  $i = 1, 2, \dots, m$ .

*Constraint:* **x**[*i* − 1]  $\geq z$  and **x**[*i* − 1]  $\leq 1/z$ , where  $z = \text{nag\_real\_safe\_small\_number}$ , the safe range parameter, for  $i = 1, 2, \dots, m$ .

6: **s** – double *Input*

*On entry:*  $S$ , the price of the underlying asset.

*Constraint:* **s**  $\geq z$  and **s**  $\leq 1.0/z$ , where  $z = \text{nag\_real\_safe\_small\_number}$ , the safe range parameter.

7: **t[n]** – const double *Input*

*On entry:* **t**[*i* − 1] must contain  $T_i$ , the *i*th time, in years, to expiry, for  $i = 1, 2, \dots, n$ .

*Constraint:* **t**[*i* − 1]  $\geq z$ , where  $z = \text{nag\_real\_safe\_small\_number}$ , the safe range parameter, for  $i = 1, 2, \dots, n$ .

8:	<b>sigma</b> – double	<i>Input</i>
	<i>On entry:</i> $\sigma$ , the annual total volatility, including jumps.	
	<i>Constraint:</i> <b>sigma</b> > 0.0.	
9:	<b>r</b> – double	<i>Input</i>
	<i>On entry:</i> $r$ , the annual risk-free interest rate, continuously compounded. Note that a rate of 5% should be entered as 0.05.	
	<i>Constraint:</i> <b>r</b> $\geq$ 0.0.	
10:	<b>lambda</b> – double	<i>Input</i>
	<i>On entry:</i> $\lambda$ , the number of expected jumps per year.	
	<i>Constraint:</i> <b>lambda</b> > 0.0.	
11:	<b>jvol</b> – double	<i>Input</i>
	<i>On entry:</i> the proportion of the total volatility associated with jumps.	
	<i>Constraint:</i> $0.0 \leq \mathbf{jvol} < 1.0$ .	
12:	<b>p[m × n]</b> – double	<i>Output</i>
	<b>Note:</b> where $\mathbf{P}(i, j)$ appears in this document, it refers to the array element	
	<b>p</b> [( $j - 1$ ) × <b>m</b> + $i - 1$ ] when <b>order</b> = Nag_ColMajor;	
	<b>p</b> [( $i - 1$ ) × <b>n</b> + $j - 1$ ] when <b>order</b> = Nag_RowMajor.	
	<i>On exit:</i> $\mathbf{P}(i, j)$ contains $P_{ij}$ , the option price evaluated for the strike price $\mathbf{x}_i$ at expiry $\mathbf{t}_j$ for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ .	
13:	<b>delta[m × n]</b> – double	<i>Output</i>
	<b>Note:</b> the ( $i, j$ )th element of the matrix is stored in	
	<b>delta</b> [( $j - 1$ ) × <b>m</b> + $i - 1$ ] when <b>order</b> = Nag_ColMajor;	
	<b>delta</b> [( $i - 1$ ) × <b>n</b> + $j - 1$ ] when <b>order</b> = Nag_RowMajor.	
	<i>On exit:</i> the $m \times n$ array <b>delta</b> contains the sensitivity, $\frac{\partial P}{\partial S}$ , of the option price to change in the price of the underlying asset.	
14:	<b>gamma[m × n]</b> – double	<i>Output</i>
	<b>Note:</b> the ( $i, j$ )th element of the matrix is stored in	
	<b>gamma</b> [( $j - 1$ ) × <b>m</b> + $i - 1$ ] when <b>order</b> = Nag_ColMajor;	
	<b>gamma</b> [( $i - 1$ ) × <b>n</b> + $j - 1$ ] when <b>order</b> = Nag_RowMajor.	
	<i>On exit:</i> the $m \times n$ array <b>gamma</b> contains the sensitivity, $\frac{\partial^2 P}{\partial S^2}$ , of <b>delta</b> to change in the price of the underlying asset.	
15:	<b>vega[m × n]</b> – double	<i>Output</i>
	<b>Note:</b> where <b>VEGA</b> ( $i, j$ ) appears in this document, it refers to the array element	
	<b>vega</b> [( $j - 1$ ) × <b>m</b> + $i - 1$ ] when <b>order</b> = Nag_ColMajor;	
	<b>vega</b> [( $i - 1$ ) × <b>n</b> + $j - 1$ ] when <b>order</b> = Nag_RowMajor.	
	<i>On exit:</i> <b>VEGA</b> ( $i, j$ ), contains the first-order Greek measuring the sensitivity of the option price $P_{ij}$ to change in the volatility of the underlying asset, i.e., $\frac{\partial P_{ij}}{\partial \sigma}$ , for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ .	

16:	<b>theta</b> [ $\mathbf{m} \times \mathbf{n}$ ] – double	<i>Output</i>
<b>Note:</b> where <b>THETA</b> ( $i, j$ ) appears in this document, it refers to the array element		
	<b>theta</b> $[(j - 1) \times \mathbf{m} + i - 1]$ when <b>order</b> = Nag_ColMajor;	
	<b>theta</b> $[(i - 1) \times \mathbf{n} + j - 1]$ when <b>order</b> = Nag_RowMajor.	
<i>On exit:</i> <b>THETA</b> ( $i, j$ ), contains the first-order Greek measuring the sensitivity of the option price $P_{ij}$ to change in time, i.e., $-\frac{\partial P_{ij}}{\partial T}$ , for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ , where $b = r - q$ .		
17:	<b>rho</b> [ $\mathbf{m} \times \mathbf{n}$ ] – double	<i>Output</i>
<b>Note:</b> where <b>RHO</b> ( $i, j$ ) appears in this document, it refers to the array element		
	<b>rho</b> $[(j - 1) \times \mathbf{m} + i - 1]$ when <b>order</b> = Nag_ColMajor;	
	<b>rho</b> $[(i - 1) \times \mathbf{n} + j - 1]$ when <b>order</b> = Nag_RowMajor.	
<i>On exit:</i> <b>RHO</b> ( $i, j$ ), contains the first-order Greek measuring the sensitivity of the option price $P_{ij}$ to change in the annual risk-free interest rate, i.e., $-\frac{\partial P_{ij}}{\partial r}$ , for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ .		
18:	<b>vanna</b> [ $\mathbf{m} \times \mathbf{n}$ ] – double	<i>Output</i>
<b>Note:</b> where <b>VANNA</b> ( $i, j$ ) appears in this document, it refers to the array element		
	<b>vanna</b> $[(j - 1) \times \mathbf{m} + i - 1]$ when <b>order</b> = Nag_ColMajor;	
	<b>vanna</b> $[(i - 1) \times \mathbf{n} + j - 1]$ when <b>order</b> = Nag_RowMajor.	
<i>On exit:</i> <b>VANNA</b> ( $i, j$ ), contains the second-order Greek measuring the sensitivity of the first-order Greek $\Delta_{ij}$ to change in the volatility of the asset price, i.e., $-\frac{\partial \Delta_{ij}}{\partial T} = -\frac{\partial^2 P_{ij}}{\partial S \partial \sigma}$ , for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ .		
19:	<b>charm</b> [ $\mathbf{m} \times \mathbf{n}$ ] – double	<i>Output</i>
<b>Note:</b> where <b>CHARM</b> ( $i, j$ ) appears in this document, it refers to the array element		
	<b>charm</b> $[(j - 1) \times \mathbf{m} + i - 1]$ when <b>order</b> = Nag_ColMajor;	
	<b>charm</b> $[(i - 1) \times \mathbf{n} + j - 1]$ when <b>order</b> = Nag_RowMajor.	
<i>On exit:</i> <b>CHARM</b> ( $i, j$ ), contains the second-order Greek measuring the sensitivity of the first-order Greek $\Delta_{ij}$ to change in the time, i.e., $-\frac{\partial \Delta_{ij}}{\partial T} = -\frac{\partial^2 P_{ij}}{\partial S \partial T}$ , for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ .		
20:	<b>speed</b> [ $\mathbf{m} \times \mathbf{n}$ ] – double	<i>Output</i>
<b>Note:</b> where <b>SPEED</b> ( $i, j$ ) appears in this document, it refers to the array element		
	<b>speed</b> $[(j - 1) \times \mathbf{m} + i - 1]$ when <b>order</b> = Nag_ColMajor;	
	<b>speed</b> $[(i - 1) \times \mathbf{n} + j - 1]$ when <b>order</b> = Nag_RowMajor.	
<i>On exit:</i> <b>SPEED</b> ( $i, j$ ), contains the third-order Greek measuring the sensitivity of the second-order Greek $\Gamma_{ij}$ to change in the price of the underlying asset, i.e., $-\frac{\partial \Gamma_{ij}}{\partial S} = -\frac{\partial^3 P_{ij}}{\partial S^3}$ , for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ .		
21:	<b>colour</b> [ $\mathbf{m} \times \mathbf{n}$ ] – double	<i>Output</i>
<b>Note:</b> where <b>COLOUR</b> ( $i, j$ ) appears in this document, it refers to the array element		
	<b>colour</b> $[(j - 1) \times \mathbf{m} + i - 1]$ when <b>order</b> = Nag_ColMajor;	
	<b>colour</b> $[(i - 1) \times \mathbf{n} + j - 1]$ when <b>order</b> = Nag_RowMajor.	
<i>On exit:</i> <b>COLOUR</b> ( $i, j$ ), contains the third-order Greek measuring the sensitivity of the second-order Greek $\Gamma_{ij}$ to change in the time, i.e., $-\frac{\partial \Gamma_{ij}}{\partial T} = -\frac{\partial^3 P_{ij}}{\partial S \partial T}$ , for $i = 1, 2, \dots, \mathbf{m}$ and $j = 1, 2, \dots, \mathbf{n}$ .		

22: **zomma**[**m** × **n**] – double Output

**Note:** where **ZOMMA**(*i, j*) appears in this document, it refers to the array element

**zomma**[(*j* – 1) × **m** + *i* – 1] when **order** = Nag\_ColMajor;  
**zomma**[(*i* – 1) × **n** + *j* – 1] when **order** = Nag\_RowMajor.

*On exit:* **ZOMMA**(*i, j*), contains the third-order Greek measuring the sensitivity of the second-order Greek  $\Gamma_{ij}$  to change in the volatility of the underlying asset, i.e.,  $-\frac{\partial\Gamma_{ij}}{\partial\sigma} = -\frac{\partial^3 P_{ij}}{\partial S^2 \partial\sigma}$ , for  $i = 1, 2, \dots, m$  and  $j = 1, 2, \dots, n$ .

23: **vomma**[**m** × **n**] – double Output

**Note:** where **VOMMA**(*i, j*) appears in this document, it refers to the array element

**vomma**[(*j* – 1) × **m** + *i* – 1] when **order** = Nag\_ColMajor;  
**vomma**[(*i* – 1) × **n** + *j* – 1] when **order** = Nag\_RowMajor.

*On exit:* **VOMMA**(*i, j*), contains the second-order Greek measuring the sensitivity of the first-order Greek  $\Delta_{ij}$  to change in the volatility of the underlying asset, i.e.,  $-\frac{\partial\Delta_{ij}}{\partial\sigma} = -\frac{\partial^2 P_{ij}}{\partial S^2}$ , for  $i = 1, 2, \dots, m$  and  $j = 1, 2, \dots, n$ .

24: **fail** – NagError \* Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry, **m** =  $\langle value \rangle$ .

Constraint: **m**  $\geq 1$ .

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq 1$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

### NE\_REAL

On entry, **jvol** =  $\langle value \rangle$ .

Constraint: **jvol**  $\geq 0.0$  and **jvol**  $< 1.0$ .

On entry, **lambda** =  $\langle value \rangle$ .

Constraint: **lambda**  $> 0.0$ .

On entry,  $\mathbf{r} = \langle value \rangle$ .

Constraint:  $\mathbf{r} \geq 0.0$ .

On entry,  $\mathbf{s} = \langle value \rangle$ .

Constraint:  $\mathbf{s} \geq \langle value \rangle$  and  $\mathbf{s} \leq \langle value \rangle$ .

On entry,  $\mathbf{sigma} = \langle value \rangle$ .

Constraint:  $\mathbf{sigma} > 0.0$ .

## NE\_REAL\_ARRAY

On entry,  $\mathbf{t}[\langle value \rangle] = \langle value \rangle$ .

Constraint:  $\mathbf{t}[i] \geq \langle value \rangle$ .

On entry,  $\mathbf{x}[\langle value \rangle] = \langle value \rangle$ .

Constraint:  $\mathbf{x}[i] \geq \langle value \rangle$  and  $\mathbf{x}[i] \leq \langle value \rangle$ .

## 7 Accuracy

The accuracy of the output is dependent on the accuracy of the cumulative Normal distribution function,  $\Phi$ , occurring in  $C_j$ . This is evaluated using a rational Chebyshev expansion, chosen so that the maximum relative error in the expansion is of the order of the **machine precision** (see nag\_cumul\_normal (s15abc) and nag\_erfc (s15adc)). An accuracy close to **machine precision** can generally be expected.

## 8 Parallelism and Performance

nag\_jumpdiff\_merton\_greeks (s30jbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

None.

## 10 Example

This example computes the price of two European calls with jumps. The time to expiry is 6 months, the stock price is 100 and strike prices are 80 and 90 respectively. The number of jumps per year is 5 and the percentage of the total volatility due to jumps is 25%. The risk-free interest rate is 8% per year while the total volatility is 25% per year.
