

NAG Library Routine Document

D02UWF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

D02UWF interpolates from a set of function values on a supplied grid onto a set of values for a uniform grid on the same range. The interpolation is performed using barycentric Lagrange interpolation. D02UWF is primarily a utility routine to map a set of function values specified on a Chebyshev Gauss–Lobatto grid onto a uniform grid.

2 Specification

```
SUBROUTINE D02UWF (N, NIP, X, F, XIP, FIP, IFAIL)
  INTEGER          N, NIP, IFAIL
  REAL (KIND=nag_wp) X(N+1), F(N+1), XIP(NIP), FIP(NIP)
```

3 Description

D02UWF interpolates from a set of $n + 1$ function values, $f(x_i)$, on a supplied grid, x_i , for $i = 0, 1, \dots, n$, onto a set of m values, $\hat{f}(\hat{x}_j)$, on a uniform grid, \hat{x}_j , for $j = 1, 2, \dots, m$. The image \hat{x} has the same range as x , so that $\hat{x}_j = x_{\min} + ((j - 1)/(m - 1)) \times (x_{\max} - x_{\min})$, for $j = 1, 2, \dots, m$. The interpolation is performed using barycentric Lagrange interpolation as described in Berrut and Trefethen (2004).

D02UWF is primarily a utility routine to map a set of function values specified on a Chebyshev Gauss–Lobatto grid computed by D02UCF onto an evenly-spaced grid with the same range as the original grid.

5 Parameters

- 1: N – INTEGER *Input*
On entry: n , where the number of grid points for the input data is $n + 1$.
Constraint: $N > 0$ and N is even.
- 2: NIP – INTEGER *Input*
On entry: the number, m , of grid points in the uniform mesh \hat{x} onto which function values are interpolated. If $NIP = 1$ then on successful exit from D02UWF, $FIP(1)$ will contain the value $f(x_n)$.
Constraint: $NIP > 0$.
- 3: X(N + 1) – REAL (KIND=nag_wp) array *Input*
On entry: the grid points, x_i , for $i = 0, 1, \dots, n$, at which the function is specified.
 Usually this should be the array of Chebyshev Gauss–Lobatto points returned in D02UCF.
- 4: F(N + 1) – REAL (KIND=nag_wp) array *Input*
On entry: the function values, $f(x_i)$, for $i = 0, 1, \dots, n$.

- 5: XIP(NIP) – REAL (KIND=nag_wp) array Output
On exit: the evenly-spaced grid points, \hat{x}_j , for $j = 1, 2, \dots, m$.
- 6: FIP(NIP) – REAL (KIND=nag_wp) array Output
On exit: the set of interpolated values $\hat{f}(\hat{x}_j)$, for $j = 1, 2, \dots, m$. Here $\hat{f}(\hat{x}_j) \approx f(x = \hat{x}_j)$.
- 7: IFAIL – INTEGER Input/Output
On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.
- For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**
- On exit:* IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, N = *value*.
 Constraint: N > 0.

On entry, N = *value*.
 Constraint: N is even.

IFAIL = 2

On entry, NIP = *value*.
 Constraint: NIP > 0.

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.
 See Section 3.8 in the Essential Introduction for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.
 See Section 3.7 in the Essential Introduction for further information.

IFAIL = -999

Dynamic memory allocation failed.
 See Section 3.6 in the Essential Introduction for further information.

7 Accuracy

D02UWF is intended, primarily, for use with Chebyshev Gauss-Lobatto input grids. For such input grids and for well-behaved functions (no discontinuities, peaks or cusps), the accuracy should be a small multiple of *machine precision*.

8 Parallelism and Performance

Not applicable.

9 Further Comments

None.

10 Example

This example interpolates the function $x + \cos(5x)$, as specified on a 65-point Gauss–Lobatto grid on $[-1, 1]$, onto a coarse uniform grid.
