

## NAG Library Routine Document

### F16ECF (BLAS\_DAXPBY)

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

## 1 Purpose

F16ECF (BLAS\_DAXPBY) computes the sum of two scaled vectors, for real vectors and scalars.

## 2 Specification

```
SUBROUTINE F16ECF (N, ALPHA, X, INCX, BETA, Y, INCY)
INTEGER N, INCX, INCY
REAL (KIND=nag_wp) ALPHA, X(1+(N-1)*ABS(INCX)), BETA,
Y(1+(N-1)*ABS(INCY)) &
```

The routine may be called by its BLAST name *blas\_daxpby*.

## 3 Description

F16ECF (BLAS\_DAXPBY) performs the operation

$$y \leftarrow \alpha x + \beta y$$

where  $x$  and  $y$  are  $n$ -element real vectors, and  $\alpha$  and  $\beta$  real scalars. If  $n$  is equal to zero, or if  $\alpha$  is equal to zero and  $\beta$  is equal to 1, this routine returns immediately.

## 5 Parameters

- |   |              |
|---|--------------|
| 1: N – INTEGER  | <i>Input</i> |
| <i>On entry:</i> $n$ , the number of elements in $x$ and $y$ .  |              |
| 2: ALPHA – REAL (KIND=nag_wp)   | <i>Input</i> |
| <i>On entry:</i> the scalar $\alpha$ .  |              |
| 3: X( $1 + (N - 1) \times  \text{INCX} $ ) – REAL (KIND=nag_wp) array   | <i>Input</i> |
| <i>On entry:</i> the $n$ -element vector $x$ .  |              |
| If $\text{INCX} > 0$ , $x_i$ must be stored in $X((i - 1) \times  \text{INCX}  + 1)$ , for $i = 1, 2, \dots, N$ . |              |
| If $\text{INCX} < 0$ , $x_i$ must be stored in $X((N - i) \times  \text{INCX}  - 1)$ , for $i = 1, 2, \dots, N$ . |              |
| Intermediate elements of $X$ are not referenced.  |              |
| 4: INCX – INTEGER   | <i>Input</i> |
| <i>On entry:</i> the increment in the subscripts of $X$ between successive elements of $x$ .                      |              |
| <i>Constraint:</i> $\text{INCX} \neq 0$ .   |              |

5:	BETA – REAL (KIND=nag_wp)	<i>Input</i>
<i>On entry:</i> the scalar $\beta$ .		
6:	Y( $1 + (N - 1) \times  \text{INCY} $ ) – REAL (KIND=nag_wp) array	<i>Input/Output</i>
<i>On entry:</i> the $n$ -element vector $y$ .		
If $\text{INCY} > 0$ , $y_i$ must be stored in $\text{Y}(1 + (i - 1) \times \text{INCY})$ , for $i = 1, 2, \dots, N$ .		
If $\text{INCY} < 0$ , $y_i$ must be stored in $\text{Y}(1 - (N - i) \times \text{INCY})$ , for $i = 1, 2, \dots, N$ .		
Intermediate elements of Y are not referenced.		
<i>On exit:</i> the updated vector $y$ stored in the array elements used to supply the original vector $y$ .		
Intermediate elements of Y are unchanged.		
7:	INCY – INTEGER	<i>Input</i>
<i>On entry:</i> the increment in the subscripts of Y between successive elements of $y$ .		
<i>Constraint:</i> $\text{INCY} \neq 0$ .		

## 6 Error Indicators and Warnings

If  $\text{INCX} = 0$  or  $\text{INCY} = 0$ , an error message is printed and program execution is terminated.

## 7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

## 8 Parallelism and Performance

F16ECF (BLAS\_DAXPBY) is not threaded by NAG in any implementation.

F16ECF (BLAS\_DAXPBY) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

None.

## 10 Example

This example computes the result of a scaled vector accumulation for

$$\begin{aligned}\alpha &= 3, & x &= (-4, 2.1, 3.7, 4.5, -6)^T, \\ \beta &= -1, & y &= (-3, -2.4, 6.4, -5, -5.1)^T.\end{aligned}$$

## 10.1 Program Text

```

Program f16ecfe
