

NAG Library Routine Document

G01ALF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

G01ALF calculates a five-point summary for a single sample.

2 Specification

```
SUBROUTINE G01ALF (N, X, IWRK, RES, IFAIL)
  INTEGER          N, IWRK(N), IFAIL
  REAL (KIND=nag_wp) X(N), RES(5)
```

3 Description

G01ALF calculates the minimum, lower hinge, median, upper hinge and the maximum of a sample of n observations.

The data consist of a single sample of n observations denoted by x_i and let z_i , for $i = 1, 2, \dots, n$, represent the sample observations sorted into ascending order.

Let $m = \frac{n}{2}$ if n is even and $\frac{(n+1)}{2}$ if n is odd,

and $k = \frac{m}{2}$ if m is even and $\frac{(m+1)}{2}$ if m is odd.

Then we have

Minimum	= z_1 ,	
Maximum	= z_n ,	
Median	= z_m	if n is odd,
	= $\frac{z_m + z_{m+1}}{2}$	if n is even,
Lower hinge	= z_k	if m is odd,
	= $\frac{z_k + z_{k+1}}{2}$	if m is even,
Upper hinge	= z_{n-k+1}	if m is odd,
	= $\frac{z_{n-k} + z_{n-k+1}}{2}$	if m is even.

5 Parameters

1: N – INTEGER

Input

On entry: n , number of observations in the sample.

Constraint: $N \geq 5$.

- 2: X(N) – REAL (KIND=nag_wp) array *Input*
On entry: the sample observations, x_1, x_2, \dots, x_n .
- 3: IWRK(N) – INTEGER array *Workspace*
- 4: RES(5) – REAL (KIND=nag_wp) array *Output*
On exit: RES contains the five-point summary.
 RES(1)
 The minimum.
 RES(2)
 The lower hinge.
 RES(3)
 The median.
 RES(4)
 The upper hinge.
 RES(5)
 The maximum.
- 5: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, –1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.
 For environments where it might be inappropriate to halt program execution when an error is detected, the value –1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value –1 or 1 is used it is essential to test the value of IFAIL on exit.**
On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or –1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

 On entry, $N < 5$.

IFAIL = –99

 An unexpected error has been triggered by this routine. Please contact NAG.

 See Section 3.8 in the Essential Introduction for further information.

IFAIL = –399

 Your licence key may have expired or may not have been installed correctly.

 See Section 3.7 in the Essential Introduction for further information.

IFAIL = –999

 Dynamic memory allocation failed.

 See Section 3.6 in the Essential Introduction for further information.

7 Accuracy

The computations are stable.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The time taken by G01ALF is proportional to n .

10 Example

This example calculates a five-point summary for a sample of 12 observations.
