NAG Library Routine Document

G05SFF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

G05SFF generates a vector of pseudorandom numbers from a (negative) exponential distribution with mean a.

2 Specification

```
SUBROUTINE G05SFF (N, A, STATE, X, IFAIL)
INTEGER            N, STATE(*), IFAIL
REAL (KIND=nag_wp) A, X(N)
```

3 Description

The exponential distribution has PDF (probability density function):

$$f(x) = \tfrac{1}{a}e^{-x/a} \quad \text{if } x \geq 0,$$

$$f(x) = 0 \qquad \text{otherwise.}$$

G05SFF returns the values

$$x_i = -a \ln y_i$$

where y_i are the next n numbers generated by a uniform $(0, 1]$ generator.

One of the initialization routines G05KFF (for a repeatable sequence if computed sequentially) or G05KGF (for a non-repeatable sequence) must be called prior to the first call to G05SFF.

5 Parameters

1: N – INTEGER *Input*

On entry: n, the number of pseudorandom numbers to be generated.

Constraint: N ≥ 0.

2: A – REAL (KIND=nag_wp) *Input*

On entry: a, the mean of the distribution.

Constraint: A > 0.0.

3: STATE$(*)$ – INTEGER array *Communication Array*

Note: the actual argument supplied **must** be the array STATE supplied to the initialization routines G05KFF or G05KGF.

On entry: contains information on the selected base generator and its current state.

On exit: contains updated information on the state of the generator.

4: X(N) – REAL (KIND=nag_wp) array *Output*

On exit: the n pseudorandom numbers from the specified exponential distribution.

5: IFAIL – INTEGER *Input/Output*

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

On exit: IFAIL $= 0$ unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL $= 0$ or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL $= 1$

On entry, N $= \langle value \rangle$.
Constraint: N ≥ 0.

IFAIL $= 2$

On entry, A $= \langle value \rangle$.
Constraint: A > 0.0.

IFAIL $= 3$

On entry, STATE vector has been corrupted or not initialized.

IFAIL $= -99$

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.8 in the Essential Introduction for further information.

IFAIL $= -399$

Your licence key may have expired or may not have been installed correctly.

See Section 3.7 in the Essential Introduction for further information.

IFAIL $= -999$

Dynamic memory allocation failed.

See Section 3.6 in the Essential Introduction for further information.

7 Accuracy

Not applicable.

8 Parallelism and Performance

G05SFF is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

None.

10 Example

This example prints five pseudorandom numbers from an exponential distribution with mean 1.0, generated by a single call to G05SFF, after initialization by G05KFF.
