

NAG Library Function Document

nag_real_band_lin_solve (f04bbc)

1 Purpose

nag_real_band_lin_solve (f04bbc) computes the solution to a real system of linear equations $AX = B$, where A is an n by n band matrix, with k_l subdiagonals and k_u superdiagonals, and X and B are n by r matrices. An estimate of the condition number of A and an error bound for the computed solution are also returned.

2 Specification

```
#include <nag.h>
#include <nagf04.h>

void nag_real_band_lin_solve (Nag_OrderType order, Integer n, Integer kl,
    Integer ku, Integer nrhs, double ab[], Integer pdab, Integer ipiv[],
    double b[], Integer pdb, double *rcond, double *errbnd, NagError *fail)
```

3 Description

The LU decomposition with partial pivoting and row interchanges is used to factor A as $A = PLU$, where P is a permutation matrix, L is the product of permutation matrices and unit lower triangular matrices with k_l subdiagonals, and U is upper triangular with $(k_l + k_u)$ superdiagonals. The factored form of A is then used to solve the system of equations $AX = B$.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.
Constraint: **order** = Nag_RowMajor or Nag_ColMajor.
- 2: **n** – Integer *Input*
On entry: the number of linear equations n , i.e., the order of the matrix A .
Constraint: **n** \geq 0.
- 3: **kl** – Integer *Input*
On entry: the number of subdiagonals k_l , within the band of A .
Constraint: **kl** \geq 0.

- 4: **ku** – Integer *Input*
On entry: the number of superdiagonals k_u , within the band of A .
Constraint: $\mathbf{ku} \geq 0$.
- 5: **nrhs** – Integer *Input*
On entry: the number of right-hand sides r , i.e., the number of columns of the matrix B .
Constraint: $\mathbf{nrhs} \geq 0$.
- 6: **ab**[*dim*] – double *Input/Output*
Note: the dimension, *dim*, of the array **ab** must be at least $\max(1, \mathbf{pdab} \times \mathbf{n})$.
On entry: the n by n matrix A .
This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements A_{ij} , for row $i = 1, \dots, n$ and column $j = \max(1, i - k_l), \dots, \min(n, i + k_u)$, depends on the **order** argument as follows:
if **order** = Nag_ColMajor, A_{ij} is stored as $\mathbf{ab}[(j - 1) \times \mathbf{pdab} + \mathbf{kl} + \mathbf{ku} + i - j]$;
if **order** = Nag_RowMajor, A_{ij} is stored as $\mathbf{ab}[(i - 1) \times \mathbf{pdab} + \mathbf{kl} + j - i]$.
See Section 9 for further details.
On exit: **ab** is overwritten by details of the factorization.
The elements, u_{ij} , of the upper triangular band factor U with $k_l + k_u$ super-diagonals, and the multipliers, l_{ij} , used to form the lower triangular factor L are stored. The elements u_{ij} , for $i = 1, \dots, n$ and $j = i, \dots, \min(n, i + k_l + k_u)$, and l_{ij} , for $i = 1, \dots, n$ and $j = \max(1, i - k_l), \dots, i$, are stored where A_{ij} is stored on entry.
- 7: **pdab** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **ab**.
Constraint: $\mathbf{pdab} \geq 2 \times \mathbf{kl} + \mathbf{ku} + 1$.
- 8: **ipiv**[**n**] – Integer *Output*
On exit: if **fail.code** = NE_NOERROR, the pivot indices that define the permutation matrix P ; at the i th step row i of the matrix was interchanged with row **ipiv**[$i - 1$]. **ipiv**[$i - 1$] = i indicates a row interchange was not required.
- 9: **b**[*dim*] – double *Input/Output*
Note: the dimension, *dim*, of the array **b** must be at least
 $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = Nag_ColMajor;
 $\max(1, \mathbf{n} \times \mathbf{pdb})$ when **order** = Nag_RowMajor.
The (i, j)th element of the matrix B is stored in
 $\mathbf{b}[(j - 1) \times \mathbf{pdb} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{b}[(i - 1) \times \mathbf{pdb} + j - 1]$ when **order** = Nag_RowMajor.
On entry: the n by r matrix of right-hand sides B .
On exit: if **fail.code** = NE_NOERROR or NE_RCOND, the n by r solution matrix X .
- 10: **pdb** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) in the array **b**.

Constraints:

if **order** = Nag_ColMajor, **pdb** $\geq \max(1, \mathbf{n})$;
 if **order** = Nag_RowMajor, **pdb** $\geq \max(1, \mathbf{nrhs})$.

11: **rcond** – double *

Output

On exit: if no constraints are violated, an estimate of the reciprocal of the condition number of the matrix A , computed as $\mathbf{rcond} = 1 / (\|A\|_1 \|A^{-1}\|_1)$.

12: **errbnd** – double *

Output

On exit: if **fail.code** = NE_NOERROR or NE_RCOND, an estimate of the forward error bound for a computed solution \hat{x} , such that $\|\hat{x} - x\|_1 / \|x\|_1 \leq \mathbf{errbnd}$, where \hat{x} is a column of the computed solution returned in the array **b** and x is the corresponding column of the exact solution X . If **rcond** is less than *machine precision*, then **errbnd** is returned as unity.

13: **fail** – NagError *

Input/Output

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

The Integer allocatable memory required is \mathbf{n} , and the double allocatable memory required is $3 \times \mathbf{n}$. In this case the factorization and the solution X have been computed, but **rcond** and **errbnd** have not been computed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, **kl** = $\langle value \rangle$.

Constraint: **kl** ≥ 0 .

On entry, **ku** = $\langle value \rangle$.

Constraint: **ku** ≥ 0 .

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **nrhs** = $\langle value \rangle$.

Constraint: **nrhs** ≥ 0 .

On entry, **pdab** = $\langle value \rangle$.

Constraint: **pdab** > 0 .

On entry, **pdb** = $\langle value \rangle$.

Constraint: **pdb** > 0 .

NE_INT_2

On entry, **pdb** = $\langle value \rangle$ and **n** = $\langle value \rangle$.

Constraint: **pdb** $\geq \max(1, \mathbf{n})$.

On entry, **pdb** = $\langle value \rangle$ and **nrhs** = $\langle value \rangle$.

Constraint: **pdb** $\geq \max(1, \mathbf{nrhs})$.

NE_INT_3

On entry, **pdab** = $\langle value \rangle$, **kl** = $\langle value \rangle$ and **ku** = $\langle value \rangle$.
 Constraint: **pdab** $\geq 2 \times \mathbf{kl} + \mathbf{ku} + 1$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
 See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
 See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

NE_RCOND

A solution has been computed, but **rcond** is less than *machine precision* so that the matrix A is numerically singular.

NE_SINGULAR

Diagonal element $\langle value \rangle$ of the upper triangular factor is zero. The factorization has been completed, but the solution could not be computed.

7 Accuracy

The computed solution for a single right-hand side, \hat{x} , satisfies an equation of the form

$$(A + E)\hat{x} = b,$$

where

$$\|E\|_1 = O(\epsilon)\|A\|_1$$

and ϵ is the *machine precision*. An approximate error bound for the computed solution is given by

$$\frac{\|\hat{x} - x\|_1}{\|x\|_1} \leq \kappa(A) \frac{\|E\|_1}{\|A\|_1},$$

where $\kappa(A) = \|A^{-1}\|_1 \|A\|_1$, the condition number of A with respect to the solution of the linear equations. `nag_real_band_lin_solve` (f04bbc) uses the approximation $\|E\|_1 = \epsilon \|A\|_1$ to estimate **errbnd**. See Section 4.4 of Anderson *et al.* (1999) for further details.

8 Parallelism and Performance

`nag_real_band_lin_solve` (f04bbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_real_band_lin_solve` (f04bbc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The band storage scheme for the array **ab** stored in `Nag_ColMajor` is illustrated by the following example, when $n = 5$, $k_l = 2$, and $k_u = 1$. Storage of the band matrix A in the array **ab**:

Band matrix A	Band storage in array \mathbf{ab}	
	order = Nag_ColMajor	order = Nag_RowMajor
a_{11} a_{12}	* * * + +	* * a_{11} a_{12} + +
a_{21} a_{22} a_{23}	* * + + +	* a_{21} a_{22} a_{23} + +
a_{31} a_{32} a_{33} a_{34}	* a_{12} a_{23} a_{34} a_{45}	a_{31} a_{32} a_{33} a_{34} + *
a_{42} a_{43} a_{44} a_{45}	a_{11} a_{22} a_{33} a_{44} a_{55}	a_{42} a_{43} a_{44} a_{45} * *
a_{53} a_{54} a_{55}	a_{21} a_{32} a_{43} a_{54} *	a_{53} a_{54} a_{55} * * *
	a_{31} a_{42} a_{53} * *	

Array elements marked * need not be set and are not referenced by the function. Array elements marked + need not be set, but are defined on exit from the function and contain the elements u_{13} , u_{14} , u_{24} , u_{25} and u_{35} . In this example when **order** = Nag_ColMajor the first referenced element of **ab** is **ab**[3] = a_{11} ; while for **order** = Nag_RowMajor the first referenced element is **ab**[2] = a_{11} .

In general, elements a_{ij} are stored as follows:

if **order** = Nag_ColMajor, a_{ij} are stored in **ab**[($j - 1$) \times **pdab** + **kl** + **ku** + $i - j$]

if **order** = Nag_RowMajor, a_{ij} are stored in **ab**[($i - 1$) \times **pdab** + **kl** + $j - i$]

where $\max(1, i - \mathbf{kl}) \leq j \leq \min(\mathbf{n}, i + \mathbf{ku})$.

The total number of floating-point operations required to solve the equations $AX = B$ depends upon the pivoting required, but if $n \gg k_l + k_u$ then it is approximately bounded by $O(nk_l(k_l + k_u))$ for the factorization and $O(n(2k_l + k_u)r)$ for the solution following the factorization. The condition number estimation typically requires between four and five solves and never more than eleven solves, following the factorization.

In practice the condition number estimator is very reliable, but it can underestimate the true condition number; see Section 15.3 of Higham (2002) for further details.

The complex analogue of nag_real_band_lin_solve (f04bbc) is nag_complex_band_lin_solve (f04cbc).

10 Example

This example solves the equations

$$AX = B,$$

where A is the band matrix

$$A = \begin{pmatrix} -0.23 & 2.54 & -3.66 & 0 \\ -6.98 & 2.46 & -2.73 & -2.13 \\ 0 & 2.56 & 2.46 & 4.07 \\ 0 & 0 & -4.78 & -3.82 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 4.42 & -36.01 \\ 27.13 & -31.67 \\ -6.14 & -1.16 \\ 10.50 & -25.82 \end{pmatrix}.$$

An estimate of the condition number of A and an approximate error bound for the computed solutions are also printed.
