## nag\_zunmrq (f08cxc)

### 1 Purpose

nag\_zunmrq (f08cxc) multiplies a general complex  $m$  by  $n$  matrix  $C$  by the complex unitary matrix  $Q$  from an  $RQ$  factorization computed by nag\_zgerqf (f08cvc).

### 2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_zunmrq (Nag_OrderType order, Nag_SideType side,
                Nag_TransType trans, Integer m, Integer n, Integer k, Complex a[],
                Integer pda, const Complex tau[], Complex c[], Integer pdc,
                NagError *fail)
```

### 3 Description

nag\_zunmrq (f08cxc) is intended to be used following a call to nag\_zgerqf (f08cvc), which performs an  $RQ$  factorization of a complex matrix  $A$  and represents the unitary matrix  $Q$  as a product of elementary reflectors.

This function may be used to form one of the matrix products

$$QC, \quad Q^H C, \quad CQ, \quad CQ^H,$$

overwriting the result on  $C$ , which may be any complex rectangular  $m$  by  $n$  matrix.

A common application of this function is in solving underdetermined linear least squares problems, as described in the f08 Chapter Introduction, and illustrated in Section 10 in nag\_zgerqf (f08cvc).
