

# NAG Library Function Document

## nag\_dgesdd (f08kdc)

### 1 Purpose

nag\_dgesdd (f08kdc) computes the singular value decomposition (SVD) of a real  $m$  by  $n$  matrix  $A$ , optionally computing the left and/or right singular vectors, by using a divide-and-conquer method.

### 2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_dgesdd (Nag_OrderType order, Nag_JobType job, Integer m, Integer n,
                double a[], Integer pda, double s[], double u[], Integer pdu,
                double vt[], Integer pdvt, NagError *fail)
```

### 3 Description

The SVD is written as

$$A = U\Sigma V^T,$$

where  $\Sigma$  is an  $m$  by  $n$  matrix which is zero except for its  $\min(m, n)$  diagonal elements,  $U$  is an  $m$  by  $m$  orthogonal matrix, and  $V$  is an  $n$  by  $n$  orthogonal matrix. The diagonal elements of  $\Sigma$  are the singular values of  $A$ ; they are real and non-negative, and are returned in descending order. The first  $\min(m, n)$  columns of  $U$  and  $V$  are the left and right singular vectors of  $A$ .

Note that the function returns  $V^T$ , not  $V$ .

### 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **job** – Nag\_JobType *Input*

*On entry:* specifies options for computing all or part of the matrix  $U$ .

**job** = Nag\_DoAll

All  $m$  columns of  $U$  and all  $n$  rows of  $V^T$  are returned in the arrays **u** and **vt**.

**job** = Nag\_DoSquare

The first  $\min(m, n)$  columns of  $U$  and the first  $\min(m, n)$  rows of  $V^T$  are returned in the arrays **u** and **vt**.

**job** = Nag\_DoOverwrite

If  $m \geq n$ , the first  $n$  columns of  $U$  are overwritten on the array **a** and all rows of  $V^T$  are returned in the array **vt**. Otherwise, all columns of  $U$  are returned in the array **u** and the first  $m$  rows of  $V^T$  are overwritten in the array **vt**.

**job** = Nag\_DoNothing

No columns of  $U$  or rows of  $V^T$  are computed.

*Constraint:* **job** = Nag\_DoAll, Nag\_DoSquare, Nag\_DoOverwrite or Nag\_DoNothing.

3: **m** – Integer *Input*

*On entry:*  $m$ , the number of rows of the matrix  $A$ .

*Constraint:*  $m \geq 0$ .

4: **n** – Integer *Input*

*On entry:*  $n$ , the number of columns of the matrix  $A$ .

*Constraint:*  $n \geq 0$ .

5: **a**[*dim*] – double *Input/Output*

**Note:** the dimension, *dim*, of the array **a** must be at least

$\max(1, \mathbf{pda} \times \mathbf{n})$  when **order** = Nag\_ColMajor;  
 $\max(1, \mathbf{m} \times \mathbf{pda})$  when **order** = Nag\_RowMajor.

The ( $i, j$ )th element of the matrix  $A$  is stored in

**a**[( $j - 1$ )  $\times$  **pda** +  $i - 1$ ] when **order** = Nag\_ColMajor;  
**a**[( $i - 1$ )  $\times$  **pda** +  $j - 1$ ] when **order** = Nag\_RowMajor.

*On entry:* the  $m$  by  $n$  matrix  $A$ .

*On exit:* if **job** = Nag\_DoOverwrite, **a** is overwritten with the first  $n$  columns of  $U$  (the left singular vectors, stored column-wise) if  $m \geq n$ ; **a** is overwritten with the first  $m$  rows of  $V^T$  (the right singular vectors, stored row-wise) otherwise.

If **job**  $\neq$  Nag\_DoOverwrite, the contents of **a** are destroyed.

6: **pda** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **a**.

*Constraints:*

if **order** = Nag\_ColMajor, **pda**  $\geq \max(1, \mathbf{m})$ ;  
 if **order** = Nag\_RowMajor, **pda**  $\geq \max(1, \mathbf{n})$ .

7: **s**[ $\min(\mathbf{m}, \mathbf{n})$ ] – double *Output*

*On exit:* the singular values of  $A$ , sorted so that  $\mathbf{s}[i - 1] \geq \mathbf{s}[i]$ .

8: **u**[*dim*] – double *Output*

**Note:** the dimension, *dim*, of the array **u** must be at least

$\max(1, \mathbf{pdu} \times \mathbf{m})$  when **job** = Nag\_DoAll or **job** = Nag\_DoOverwrite and  $\mathbf{m} < \mathbf{n}$ ;  
 $\max(1, \mathbf{pdu} \times \min(\mathbf{m}, \mathbf{n}))$  when **job** = Nag\_DoSquare and **order** = Nag\_ColMajor;  
 $\max(1, \mathbf{m} \times \mathbf{pdu})$  when **job** = Nag\_DoSquare and **order** = Nag\_RowMajor;  
 $\max(1, \mathbf{m})$  otherwise.

The  $(i, j)$ th element of the matrix  $U$  is stored in

$$\begin{aligned} &\mathbf{u}[(j-1) \times \mathbf{pdu} + i - 1] \text{ when } \mathbf{order} = \text{Nag\_ColMajor}; \\ &\mathbf{u}[(i-1) \times \mathbf{pdu} + j - 1] \text{ when } \mathbf{order} = \text{Nag\_RowMajor}. \end{aligned}$$

*On exit:*

If  $\mathbf{job} = \text{Nag\_DoAll}$  or  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} < \mathbf{n}$ ,  $\mathbf{u}$  contains the  $m$  by  $m$  orthogonal matrix  $U$ .

If  $\mathbf{job} = \text{Nag\_DoSquare}$ ,  $\mathbf{u}$  contains the first  $\min(m, n)$  columns of  $U$  (the left singular vectors, stored column-wise).

If  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} \geq \mathbf{n}$ , or  $\mathbf{job} = \text{Nag\_DoNothing}$ ,  $\mathbf{u}$  is not referenced.

9: **pdu** – Integer

*Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array  $\mathbf{u}$ .

*Constraints:*

if  $\mathbf{order} = \text{Nag\_ColMajor}$ ,  
 if  $\mathbf{job} = \text{Nag\_DoAll}$  or  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} < \mathbf{n}$ ,  $\mathbf{pdu} \geq \max(1, \mathbf{m})$ ;  
 if  $\mathbf{job} = \text{Nag\_DoSquare}$ ,  $\mathbf{pdu} \geq \max(1, \mathbf{m})$ ;  
 otherwise  $\mathbf{pdu} \geq 1$ .;  
 if  $\mathbf{order} = \text{Nag\_RowMajor}$ ,  
 if  $\mathbf{job} = \text{Nag\_DoAll}$  or  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} < \mathbf{n}$ ,  $\mathbf{pdu} \geq \max(1, \mathbf{m})$ ;  
 if  $\mathbf{job} = \text{Nag\_DoSquare}$ ,  $\mathbf{pdu} \geq \max(1, \min(\mathbf{m}, \mathbf{n}))$ ;  
 otherwise  $\mathbf{pdu} \geq 1$ .

10: **vt** $[dim]$  – double

*Output*

**Note:** the dimension,  $dim$ , of the array  $\mathbf{vt}$  must be at least

$\max(1, \mathbf{pdvt} \times \mathbf{n})$  when  $\mathbf{job} = \text{Nag\_DoAll}$  or  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} \geq \mathbf{n}$ ;  
 $\max(1, \mathbf{pdvt} \times \mathbf{n})$  when  $\mathbf{job} = \text{Nag\_DoSquare}$  and  $\mathbf{order} = \text{Nag\_ColMajor}$ ;  
 $\max(1, \min(\mathbf{m}, \mathbf{n}) \times \mathbf{pdvt})$  when  $\mathbf{job} = \text{Nag\_DoSquare}$  and  $\mathbf{order} = \text{Nag\_RowMajor}$ ;  
 $\max(1, \min(\mathbf{m}, \mathbf{n}))$  otherwise.

The  $(i, j)$ th element of the matrix is stored in

$$\begin{aligned} &\mathbf{vt}[(j-1) \times \mathbf{pdvt} + i - 1] \text{ when } \mathbf{order} = \text{Nag\_ColMajor}; \\ &\mathbf{vt}[(i-1) \times \mathbf{pdvt} + j - 1] \text{ when } \mathbf{order} = \text{Nag\_RowMajor}. \end{aligned}$$

*On exit:* if  $\mathbf{job} = \text{Nag\_DoAll}$  or  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} \geq \mathbf{n}$ ,  $\mathbf{vt}$  contains the  $n$  by  $n$  orthogonal matrix  $V^T$ .

If  $\mathbf{job} = \text{Nag\_DoSquare}$ ,  $\mathbf{vt}$  contains the first  $\min(m, n)$  rows of  $V^T$  (the right singular vectors, stored row-wise).

If  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} < \mathbf{n}$ , or  $\mathbf{job} = \text{Nag\_DoNothing}$ ,  $\mathbf{vt}$  is not referenced.

11: **pdvt** – Integer

*Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array  $\mathbf{vt}$ .

*Constraints:*

if  $\mathbf{order} = \text{Nag\_ColMajor}$ ,  
 if  $\mathbf{job} = \text{Nag\_DoAll}$  or  $\mathbf{job} = \text{Nag\_DoOverwrite}$  and  $\mathbf{m} \geq \mathbf{n}$ ,  $\mathbf{pdvt} \geq \max(1, \mathbf{n})$ ;  
 if  $\mathbf{job} = \text{Nag\_DoSquare}$ ,  $\mathbf{pdvt} \geq \max(1, \min(\mathbf{m}, \mathbf{n}))$ ;  
 otherwise  $\mathbf{pdvt} \geq 1$ .;

if **order** = Nag\_RowMajor,  
     if **job** = Nag\_DoAll or **job** = Nag\_DoOverwrite and  $\mathbf{m} \geq \mathbf{n}$ , **pdvt**  $\geq \max(1, \mathbf{n})$ ;  
     if **job** = Nag\_DoSquare, **pdvt**  $\geq \max(1, \mathbf{n})$ ;  
     otherwise **pdvt**  $\geq 1$ ..

12: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_CONVERGENCE

nag\_dgesdd (f08kdc) did not converge, the updating process failed.

### NE\_ENUM\_INT\_3

On entry, **job** =  $\langle value \rangle$ , **pdu** =  $\langle value \rangle$ , **m** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **job** = Nag\_DoAll or **job** = Nag\_DoOverwrite and  $\mathbf{m} < \mathbf{n}$ , **pdu**  $\geq \max(1, \mathbf{m})$ ;

if **job** = Nag\_DoSquare, **pdu**  $\geq \max(1, \mathbf{m})$ ;

otherwise **pdu**  $\geq 1$ .

On entry, **job** =  $\langle value \rangle$ , **pdu** =  $\langle value \rangle$ , **m** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **job** = Nag\_DoAll or **job** = Nag\_DoOverwrite and  $\mathbf{m} < \mathbf{n}$ , **pdu**  $\geq \max(1, \mathbf{m})$ ;

if **job** = Nag\_DoSquare, **pdu**  $\geq \max(1, \min(\mathbf{m}, \mathbf{n}))$ ;

otherwise **pdu**  $\geq 1$ .

On entry, **job** =  $\langle value \rangle$ , **pdvt** =  $\langle value \rangle$ , **m** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **job** = Nag\_DoAll or **job** = Nag\_DoOverwrite and  $\mathbf{m} \geq \mathbf{n}$ , **pdvt**  $\geq \max(1, \mathbf{n})$ ;

if **job** = Nag\_DoSquare, **pdvt**  $\geq \max(1, \min(\mathbf{m}, \mathbf{n}))$ ;

otherwise **pdvt**  $\geq 1$ .

On entry, **job** =  $\langle value \rangle$ , **pdvt** =  $\langle value \rangle$ , **m** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **job** = Nag\_DoAll or **job** = Nag\_DoOverwrite and  $\mathbf{m} \geq \mathbf{n}$ , **pdvt**  $\geq \max(1, \mathbf{n})$ ;

if **job** = Nag\_DoSquare, **pdvt**  $\geq \max(1, \mathbf{n})$ ;

otherwise **pdvt**  $\geq 1$ .

### NE\_INT

On entry, **m** =  $\langle value \rangle$ .

Constraint: **m**  $\geq 0$ .

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq 0$ .

On entry, **pda** =  $\langle value \rangle$ .

Constraint: **pda**  $> 0$ .

On entry, **pdu** =  $\langle value \rangle$ .

Constraint: **pdu**  $> 0$ .

On entry, **pdvt** =  $\langle value \rangle$ .

Constraint: **pdvt**  $> 0$ .

**NE\_INT\_2**

On entry, **pda** =  $\langle value \rangle$  and **m** =  $\langle value \rangle$ .  
 Constraint: **pda**  $\geq$   $\max(1, \mathbf{m})$ .

On entry, **pda** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .  
 Constraint: **pda**  $\geq$   $\max(1, \mathbf{n})$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.  
 See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.  
 See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

**7 Accuracy**

The computed singular value decomposition is nearly the exact singular value decomposition for a nearby matrix  $(A + E)$ , where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and  $\epsilon$  is the *machine precision*. In addition, the computed singular vectors are nearly orthogonal to working precision. See Section 4.9 of Anderson *et al.* (1999) for further details.

**8 Parallelism and Performance**

nag\_dgesdd (f08kdc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_dgesdd (f08kdc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

**9 Further Comments**

The total number of floating-point operations is approximately proportional to  $mn^2$  when  $m > n$  and  $m^2n$  otherwise.

The singular values are returned in descending order.

The complex analogue of this function is nag\_zgesdd (f08krc).

**10 Example**

This example finds the singular values and left and right singular vectors of the 4 by 6 matrix

$$A = \begin{pmatrix} 2.27 & 0.28 & -0.48 & 1.07 & -2.35 & 0.62 \\ -1.54 & -1.67 & -3.09 & 1.22 & 2.93 & -7.39 \\ 1.15 & 0.94 & 0.99 & 0.79 & -1.45 & 1.03 \\ -1.94 & -0.78 & -0.21 & 0.63 & 2.30 & -2.57 \end{pmatrix},$$

together with approximate error bounds for the computed singular values and vectors.

The example program for nag\_dgesvd (f08kbc) illustrates finding a singular value decomposition for the case  $m \geq n$ .
