## nag\_dsbgst (f08uec)

### 1 Purpose

nag\_dsbgst (f08uec) reduces a real symmetric-definite generalized eigenproblem  $Az = \lambda Bz$  to the standard form  $Cy = \lambda y$ , where  $A$  and  $B$  are band matrices,  $A$  is a real symmetric matrix, and  $B$  has been factorized by nag\_dpbstf (f08ufc).

### 2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_dsbgst (Nag_OrderType order, Nag_VectType vect, Nag_UploType uplo,
                Integer n, Integer ka, Integer kb, double ab[], Integer pdab,
                const double bb[], Integer pdbb, double x[], Integer pdx,
                NagError *fail)
```

### 3 Description

To reduce the real symmetric-definite generalized eigenproblem  $Az = \lambda Bz$  to the standard form  $Cy = \lambda y$ , where  $A$ ,  $B$  and  $C$  are banded, nag\_dsbgst (f08uec) must be preceded by a call to nag\_dpbstf (f08ufc) which computes the split Cholesky factorization of the positive definite matrix  $B$ :  $B = S^T S$ . The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This function overwrites  $A$  with  $C = X^T A X$ , where  $X = S^{-1} Q$  and  $Q$  is a orthogonal matrix chosen (implicitly) to preserve the bandwidth of  $A$ . The function also has an option to allow the accumulation of  $X$ , and then, if  $z$  is an eigenvector of  $C$ ,  $Xz$  is an eigenvector of the original system.

### 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **vect** – Nag\_VectType *Input*

*On entry:* indicates whether  $X$  is to be returned.

**vect** = Nag\_DoNotForm  
 $X$  is not returned.

**vect** = Nag\_FormX  
*X* is returned.

*Constraint:* **vect** = Nag\_DoNotForm or Nag\_FormX.

3: **uplo** – Nag\_UploType *Input*

*On entry:* indicates whether the upper or lower triangular part of *A* is stored.

**uplo** = Nag\_Upper  
 The upper triangular part of *A* is stored.

**uplo** = Nag\_Lower  
 The lower triangular part of *A* is stored.

*Constraint:* **uplo** = Nag\_Upper or Nag\_Lower.

4: **n** – Integer *Input*

*On entry:* *n*, the order of the matrices *A* and *B*.

*Constraint:* **n** ≥ 0.

5: **ka** – Integer *Input*

*On entry:* if **uplo** = Nag\_Upper, the number of superdiagonals, *k<sub>a</sub>*, of the matrix *A*.

If **uplo** = Nag\_Lower, the number of subdiagonals, *k<sub>a</sub>*, of the matrix *A*.

*Constraint:* **ka** ≥ 0.

6: **kb** – Integer *Input*

*On entry:* if **uplo** = Nag\_Upper, the number of superdiagonals, *k<sub>b</sub>*, of the matrix *B*.

If **uplo** = Nag\_Lower, the number of subdiagonals, *k<sub>b</sub>*, of the matrix *B*.

*Constraint:* **ka** ≥ **kb** ≥ 0.

7: **ab**[*dim*] – double *Input/Output*

**Note:** the dimension, *dim*, of the array **ab** must be at least max(1, **pdab** × **n**).

*On entry:* the upper or lower triangle of the *n* by *n* symmetric band matrix *A*.

This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements of *A<sub>ij</sub>*, depends on the **order** and **uplo** arguments as follows:

if **order** = Nag\_ColMajor and **uplo** = Nag\_Upper,  
*A<sub>ij</sub>* is stored in **ab**[*k<sub>a</sub>* + *i* - *j* + (*j* - 1) × **pdab**], for *j* = 1, ..., *n* and  
*i* = max(1, *j* - *k<sub>a</sub>*), ..., *j*;

if **order** = Nag\_ColMajor and **uplo** = Nag\_Lower,  
*A<sub>ij</sub>* is stored in **ab**[*i* - *j* + (*j* - 1) × **pdab**], for *j* = 1, ..., *n* and  
*i* = *j*, ..., min(*n*, *j* + *k<sub>a</sub>*);

if **order** = Nag\_RowMajor and **uplo** = Nag\_Upper,  
*A<sub>ij</sub>* is stored in **ab**[*j* - *i* + (*i* - 1) × **pdab**], for *i* = 1, ..., *n* and  
*j* = *i*, ..., min(*n*, *i* + *k<sub>a</sub>*);

if **order** = Nag\_RowMajor and **uplo** = Nag\_Lower,  
*A<sub>ij</sub>* is stored in **ab**[*k<sub>a</sub>* + *j* - *i* + (*i* - 1) × **pdab**], for *i* = 1, ..., *n* and  
*j* = max(1, *i* - *k<sub>a</sub>*), ..., *i*.

*On exit:* the upper or lower triangle of **ab** is overwritten by the corresponding upper or lower triangle of *C* as specified by **uplo**.

- 8: **pdab** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix *A* in the array **ab**.  
*Constraint:* **pdab**  $\geq$  **ka** + 1.
- 9: **bb**[*dim*] – const double *Input*  
**Note:** the dimension, *dim*, of the array **bb** must be at least  $\max(1, \mathbf{pdbb} \times \mathbf{n})$ .  
*On entry:* the banded split Cholesky factor of *B* as specified by **uplo**, **n** and **kb** and returned by nag\_dpbstf (f08ufc).
- 10: **pdbb** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **bb**.  
*Constraint:* **pdbb**  $\geq$  **kb** + 1.
- 11: **x**[*dim*] – double *Output*  
**Note:** the dimension, *dim*, of the array **x** must be at least  
 $\max(1, \mathbf{pdx} \times \mathbf{n})$  when **vect** = Nag\_FormX;  
 1 when **vect** = Nag\_DoNotForm.  
 The (*i*, *j*)th element of the matrix *X* is stored in  
 $\mathbf{x}[(j-1) \times \mathbf{pdx} + i - 1]$  when **order** = Nag\_ColMajor;  
 $\mathbf{x}[(i-1) \times \mathbf{pdx} + j - 1]$  when **order** = Nag\_RowMajor.  
*On exit:* the *n* by *n* matrix  $X = S^{-1}Q$ , if **vect** = Nag\_FormX.  
 If **vect** = Nag\_DoNotForm, **x** is not referenced.
- 12: **pdx** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **x**.  
*Constraints:*  
 if **vect** = Nag\_FormX, **pdx**  $\geq$   $\max(1, \mathbf{n})$ ;  
 if **vect** = Nag\_DoNotForm, **pdx**  $\geq$  1.
- 13: **fail** – NagError \* *Input/Output*  
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument *<value>* had an illegal value.

**NE\_ENUM\_INT\_2**

On entry, **vect** =  $\langle value \rangle$ , **pdx** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .  
 Constraint: if **vect** = Nag\_FormX, **pdx**  $\geq \max(1, \mathbf{n})$ ;  
 if **vect** = Nag\_DoNotForm, **pdx**  $\geq 1$ .

**NE\_INT**

On entry, **ka** =  $\langle value \rangle$ .  
 Constraint: **ka**  $\geq 0$ .

On entry, **n** =  $\langle value \rangle$ .  
 Constraint: **n**  $\geq 0$ .

On entry, **pdab** =  $\langle value \rangle$ .  
 Constraint: **pdab**  $> 0$ .

On entry, **pdbb** =  $\langle value \rangle$ .  
 Constraint: **pdbb**  $> 0$ .

On entry, **pdx** =  $\langle value \rangle$ .  
 Constraint: **pdx**  $> 0$ .

**NE\_INT\_2**

On entry, **ka** =  $\langle value \rangle$  and **kb** =  $\langle value \rangle$ .  
 Constraint: **ka**  $\geq \mathbf{kb} \geq 0$ .

On entry, **pdab** =  $\langle value \rangle$  and **ka** =  $\langle value \rangle$ .  
 Constraint: **pdab**  $\geq \mathbf{ka} + 1$ .

On entry, **pdbb** =  $\langle value \rangle$  and **kb** =  $\langle value \rangle$ .  
 Constraint: **pdbb**  $\geq \mathbf{kb} + 1$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.  
 See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.  
 See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

**7 Accuracy**

Forming the reduced matrix  $C$  is a stable procedure. However it involves implicit multiplication by  $B^{-1}$ . When nag\_dsbgst (f08uec) is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if  $B$  is ill-conditioned with respect to inversion.

**8 Parallelism and Performance**

nag\_dsbgst (f08uec) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The total number of floating-point operations is approximately  $6n^2k_B$ , when `vect = Nag_DoNotForm`, assuming  $n \gg k_A, k_B$ ; there are an additional  $(3/2)n^3(k_B/k_A)$  operations when `vect = Nag_FormX`.

The complex analogue of this function is `nag_zhbgst (f08usc)`.

## 10 Example

This example computes all the eigenvalues of  $Az = \lambda Bz$ , where

$$A = \begin{pmatrix} 0.24 & 0.39 & 0.42 & 0.00 \\ 0.39 & -0.11 & 0.79 & 0.63 \\ 0.42 & 0.79 & -0.25 & 0.48 \\ 0.00 & 0.63 & 0.48 & -0.03 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 2.07 & 0.95 & 0.00 & 0.00 \\ 0.95 & 1.69 & -0.29 & 0.00 \\ 0.00 & -0.29 & 0.65 & -0.33 \\ 0.00 & 0.00 & -0.33 & 1.17 \end{pmatrix}.$$

Here  $A$  is symmetric,  $B$  is symmetric positive definite, and  $A$  and  $B$  are treated as band matrices.  $B$  must first be factorized by `nag_dpbstf (f08ufc)`. The program calls `nag_dsbgst (f08uec)` to reduce the problem to the standard form  $Cy = \lambda y$ , then `nag_dsbtrd (f08hec)` to reduce  $C$  to tridiagonal form, and `nag_dsterf (f08jfc)` to compute the eigenvalues.
