

NAG Library Function Document

nag_superlu_refine_lu (f11mhc)

1 Purpose

nag_superlu_refine_lu (f11mhc) returns error bounds for the solution of a real sparse system of linear equations with multiple right-hand sides, $AX = B$ or $A^T X = B$. It improves the solution by iterative refinement in standard precision, in order to reduce the backward error as much as possible.

2 Specification

```
#include <nag.h>
#include <nagf11.h>

void nag_superlu_refine_lu (Nag_OrderType order, Nag_TransType trans,
    Integer n, const Integer icolzp[], const Integer irowix[],
    const double a[], const Integer iprm[], const Integer il[],
    const double lval[], const Integer iu[], const double uval[],
    Integer nrhs, const double b[], Integer pdb, double x[], Integer pdx,
    double ferr[], double berr[], NagError *fail)
```

3 Description

nag_superlu_refine_lu (f11mhc) returns the backward errors and estimated bounds on the forward errors for the solution of a real system of linear equations with multiple right-hand sides $AX = B$ or $A^T X = B$. The function handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of nag_superlu_refine_lu (f11mhc) in terms of a single right-hand side b and solution x .

Given a computed solution x , the function computes the *component-wise backward error* β . This is the size of the smallest relative perturbation in each element of A and b such that if x is the exact solution of a perturbed system:

$$(A + \delta A)x = b + \delta b$$

then $|\delta a_{ij}| \leq \beta |a_{ij}|$ and $|\delta b_i| \leq \beta |b_i|$.

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where \hat{x} is the true solution.

The function uses the LU factorization $P_r A P_c = LU$ computed by nag_superlu_lu_factorize (f11mec) and the solution computed by nag_superlu_solve_lu (f11mfc).

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by

order = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

- 2: **trans** – Nag_TransType *Input*
On entry: specifies whether $AX = B$ or $A^T X = B$ is solved.
trans = Nag_NoTrans
 $AX = B$ is solved.
trans = Nag_Trans
 $A^T X = B$ is solved.
Constraint: **trans** = Nag_NoTrans or Nag_Trans.
- 3: **n** – Integer *Input*
On entry: n , the order of the matrix A .
Constraint: $n \geq 0$.
- 4: **icolzp** $[dim]$ – const Integer *Input*
Note: the dimension, dim , of the array **icolzp** must be at least $n + 1$.
On entry: **icolzp** $[i - 1]$ contains the index in A of the start of a new column. See Section 2.1.3 in the f11 Chapter Introduction.
- 5: **irowix** $[dim]$ – const Integer *Input*
Note: the dimension, dim , of the array **irowix** must be at least **icolzp** $[n] - 1$, the number of nonzeros of the sparse matrix A .
On entry: the row index array of sparse matrix A .
- 6: **a** $[dim]$ – const double *Input*
Note: the dimension, dim , of the array **a** must be at least **icolzp** $[n] - 1$, the number of nonzeros of the sparse matrix A .
On entry: the array of nonzero values in the sparse matrix A .
- 7: **iprm** $[7 \times n]$ – const Integer *Input*
On entry: the column permutation which defines P_c , the row permutation which defines P_r , plus associated data structures as computed by nag_superlu_lu_factorize (f11mec).
- 8: **il** $[dim]$ – const Integer *Input*
Note: the dimension, dim , of the array **il** must be at least as large as the dimension of the array of the same name in nag_superlu_lu_factorize (f11mec).
On entry: records the sparsity pattern of matrix L as computed by nag_superlu_lu_factorize (f11mec).
- 9: **lval** $[dim]$ – const double *Input*
Note: the dimension, dim , of the array **lval** must be at least as large as the dimension of the array of the same name in nag_superlu_lu_factorize (f11mec).
On entry: records the nonzero values of matrix L and some nonzero values of matrix U as computed by nag_superlu_lu_factorize (f11mec).

- 10: **iu**[*dim*] – const Integer *Input*
Note: the dimension, *dim*, of the array **iu** must be at least as large as the dimension of the array of the same name in nag_superlu_lu_factorize (f11mec).
On entry: records the sparsity pattern of matrix *U* as computed by nag_superlu_lu_factorize (f11mec).
- 11: **uval**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **uval** must be at least as large as the dimension of the array of the same name in nag_superlu_lu_factorize (f11mec).
On entry: records some nonzero values of matrix *U* as computed by nag_superlu_lu_factorize (f11mec).
- 12: **nrhs** – Integer *Input*
On entry: *nrhs*, the number of right-hand sides in *B*.
Constraint: **nrhs** ≥ 0 .
- 13: **b**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **b** must be at least
 $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = Nag_ColMajor;
 $\max(1, \mathbf{n} \times \mathbf{pdb})$ when **order** = Nag_RowMajor.
The (*i*, *j*)th element of the matrix *B* is stored in
 $\mathbf{b}[(j-1) \times \mathbf{pdb} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{b}[(i-1) \times \mathbf{pdb} + j - 1]$ when **order** = Nag_RowMajor.
On entry: the *n* by *nrhs* right-hand side matrix *B*.
- 14: **pdb** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) in the array **b**.
Constraints:
if **order** = Nag_ColMajor, **pdb** $\geq \max(1, \mathbf{n})$;
if **order** = Nag_RowMajor, **pdb** $\geq \max(1, \mathbf{nrhs})$.
- 15: **x**[*dim*] – double *Input/Output*
Note: the dimension, *dim*, of the array **x** must be at least
 $\max(1, \mathbf{pdx} \times \mathbf{nrhs})$ when **order** = Nag_ColMajor;
 $\max(1, \mathbf{n} \times \mathbf{pdx})$ when **order** = Nag_RowMajor.
The (*i*, *j*)th element of the matrix *X* is stored in
 $\mathbf{x}[(j-1) \times \mathbf{pdx} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{x}[(i-1) \times \mathbf{pdx} + j - 1]$ when **order** = Nag_RowMajor.
On entry: the *n* by *nrhs* solution matrix *X*, as returned by nag_superlu_solve_lu (f11mfc).
On exit: the *n* by *nrhs* improved solution matrix *X*.
- 16: **pdx** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) in the array **x**.

Constraints:

if **order** = Nag_ColMajor, **pdx** \geq max(1, **n**);
 if **order** = Nag_RowMajor, **pdx** \geq max(1, **nrhs**).

17: **ferr**[**nrhs**] – double *Output*

On exit: **ferr**[$j - 1$] contains an estimated error bound for the j th solution vector, that is, the j th column of X , for $j = 1, 2, \dots, nrhs$.

18: **berr**[**nrhs**] – double *Output*

On exit: **berr**[$j - 1$] contains the component-wise backward error bound β for the j th solution vector, that is, the j th column of X , for $j = 1, 2, \dots, nrhs$.

19: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** \geq 0.

On entry, **nrhs** = $\langle value \rangle$.

Constraint: **nrhs** \geq 0.

On entry, **pdb** = $\langle value \rangle$.

Constraint: **pdb** $>$ 0.

On entry, **pdx** = $\langle value \rangle$.

Constraint: **pdx** $>$ 0.

NE_INT_2

On entry, **pdb** = $\langle value \rangle$ and **n** = $\langle value \rangle$.

Constraint: **pdb** \geq max(1, **n**).

On entry, **pdb** = $\langle value \rangle$ and **nrhs** = $\langle value \rangle$.

Constraint: **pdb** \geq max(1, **nrhs**).

On entry, **pdx** = $\langle value \rangle$ and **n** = $\langle value \rangle$.

Constraint: **pdx** \geq max(1, **n**).

On entry, **pdx** = $\langle value \rangle$ and **nrhs** = $\langle value \rangle$.

Constraint: **pdx** \geq max(1, **nrhs**).

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_INVALID_PERM_COL

Incorrect column permutations in array **iprm**.

NE_INVALID_PERM_ROW

Incorrect row permutations in array **iprm**.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The bounds returned in **ferr** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Parallelism and Performance

`nag_superlu_refine_lu` (f11mhc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_superlu_refine_lu` (f11mhc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

At most five steps of iterative refinement are performed, but usually only one or two steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$ or $A^T x = b$;

10 Example

This example solves the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} 2.00 & 1.00 & 0 & 0 & 0 \\ 0 & 0 & 1.00 & -1.00 & 0 \\ 4.00 & 0 & 1.00 & 0 & 1.00 \\ 0 & 0 & 0 & 1.00 & 2.00 \\ 0 & -2.00 & 0 & 0 & 3.00 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 1.56 & 3.12 \\ -0.25 & -0.50 \\ 3.60 & 7.20 \\ 1.33 & 2.66 \\ 0.52 & 1.04 \end{pmatrix}.$$

Here A is nonsymmetric and must first be factorized by `nag_superlu_lu_factorize` (f11mec).
