

NAG Library Function Document

nag_dsf_norm (f16rkc)

1 Purpose

nag_dsf_norm (f16rkc) returns the value of the 1-norm, the ∞ -norm, the Frobenius norm, or the maximum absolute value of the elements of a real symmetric matrix A stored in Rectangular Full Packed (RFP) format.

2 Specification

```
#include <nag.h>
#include <nagf16.h>

void nag_dsf_norm (Nag_OrderType order, Nag_NormType norm,
                  Nag_RFP_Store transr, Nag_UploType uplo, Integer n, const double ar[],
                  double *r, NagError *fail)
```

3 Description

Given a real n by n symmetric matrix, A , nag_dsf_norm (f16rkc) calculates one of the values given by

$$\|A\|_1 = \max_j \sum_{i=1}^n |a_{ij}| \quad (\text{the 1-norm of } A),$$

$$\|A\|_\infty = \max_i \sum_{j=1}^n |a_{ij}| \quad (\text{the } \infty\text{-norm of } A),$$

$$\|A\|_F = \left(\sum_{i=1}^n \sum_{j=1}^n |a_{ij}|^2 \right)^{1/2} \quad (\text{the Frobenius norm of } A), \quad \text{or}$$

$$\max_{i,j} |a_{ij}| \quad (\text{the maximum absolute element value of } A).$$

A is stored in compact form using the RFP format. The RFP storage format is described in Section 3.3.3 in the f07 Chapter Introduction.

5 Arguments

1: **order** – Nag_OrderType Input

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

- 2: **norm** – Nag_NormType *Input*
On entry: specifies the value to be returned.
norm = Nag_OneNorm
 The 1-norm.
norm = Nag_InfNorm
 The ∞ -norm.
norm = Nag_FrobeniusNorm
 The Frobenius (or Euclidean) norm.
norm = Nag_MaxNorm
 The value $\max_{i,j} |a_{ij}|$ (not a norm).
Constraint: **norm** = Nag_OneNorm, Nag_InfNorm, Nag_FrobeniusNorm or Nag_MaxNorm.
- 3: **transr** – Nag_RFP_Store *Input*
On entry: specifies whether the RFP representation of A is normal or transposed.
transr = Nag_RFP_Normal
 The matrix A is stored in normal RFP format.
transr = Nag_RFP_Trans
 The matrix A is stored in transposed RFP format.
Constraint: **transr** = Nag_RFP_Normal or Nag_RFP_Trans.
- 4: **uplo** – Nag_UploType *Input*
On entry: specifies whether the upper or lower triangular part of A is stored.
uplo = Nag_Upper
 The upper triangular part of A is stored.
uplo = Nag_Lower
 The lower triangular part of A is stored.
Constraint: **uplo** = Nag_Upper or Nag_Lower.
- 5: **n** – Integer *Input*
On entry: n , the order of the matrix A .
 If $n = 0$, then nag_dsf_norm (f16rkc) returns immediately.
Constraint: $n \geq 0$.
- 6: **ar**[$n \times (n + 1)/2$] – const double *Input*
On entry: the upper or lower triangular part (as specified by **uplo**) of the n by n symmetric matrix A , in either normal or transposed RFP format (as specified by **transr**). The storage format is described in detail in Section 3.3.3 in the f07 Chapter Introduction.
- 7: **r** – double * *Output*
On exit: the value of the norm specified by **norm**.
- 8: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, $n = \langle value \rangle$.

Constraint: $n \geq 0$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Parallelism and Performance

nag_dsf_norm (f16rkc) is not threaded in any implementation.

9 Further Comments

None.

10 Example

This example reads in the lower triangular part of a symmetric matrix, converts this to RFP format, then calculates the norm of the matrix for each of the available norm types.
