

# NAG Library Routine Document

## C05RCF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

C05RCF is a comprehensive routine that finds a solution of a system of nonlinear equations by a modification of the Powell hybrid method. You must provide the Jacobian.

### 2 Specification

```

SUBROUTINE C05RCF (FCN, N, X, FVEC, FJAC, XTOL, MAXFEV, MODE, DIAG,      &
                  FACTOR, NPRINT, NFEV, NJEV, R, QTF, IUSER, RUSER,    &
                  IFAIL)

INTEGER          N, MAXFEV, MODE, NPRINT, NFEV, NJEV, IUSER(*), IFAIL
REAL (KIND=nag_wp) X(N), FVEC(N), FJAC(N,N), XTOL, DIAG(N), FACTOR,    &
                  R(N*(N+1)/2), QTF(N), RUSER(*)
EXTERNAL        FCN

```

### 3 Description

The system of equations is defined as:

$$f_i(x_1, x_2, \dots, x_n) = 0, \quad i = 1, 2, \dots, n.$$

C05RCF is based on the MINPACK routine HYBRJ (see Moré *et al.* (1980)). It chooses the correction at each step as a convex combination of the Newton and scaled gradient directions. The Jacobian is updated by the rank-1 method of Broyden. At the starting point, the Jacobian is requested, but it is not asked for again until the rank-1 method fails to produce satisfactory progress. For more details see Powell (1970).

### 5 Arguments

1: FCN – SUBROUTINE, supplied by the user. *External Procedure*

Depending upon the value of IFLAG, FCN must either return the values of the functions  $f_i$  at a point  $x$  or return the Jacobian at  $x$ .

The specification of FCN is:

```

SUBROUTINE FCN (N, X, FVEC, FJAC, IUSER, RUSER, IFLAG)
INTEGER          N, IUSER(*), IFLAG
REAL (KIND=nag_wp) X(N), FVEC(N), FJAC(N,N), RUSER(*)

```

1: N – INTEGER

*Input*

*On entry:*  $n$ , the number of equations.

2:	X(N) – REAL (KIND=nag_wp) array	<i>Input</i>
	<i>On entry:</i> the components of the point $x$ at which the functions or the Jacobian must be evaluated.	
3:	FVEC(N) – REAL (KIND=nag_wp) array	<i>Input/Output</i>
	<i>On entry:</i> if IFLAG = 0 or 2, FVEC contains the function values $f_i(x)$ and must not be changed.	
	<i>On exit:</i> if IFLAG = 1 on entry, FVEC must contain the function values $f_i(x)$ (unless IFLAG is set to a negative value by FCN).	
4:	FJAC(N,N) – REAL (KIND=nag_wp) array	<i>Input/Output</i>
	<i>On entry:</i> if IFLAG = 0, FJAC( $i,j$ ) contains the value of $\frac{\partial f_i}{\partial x_j}$ at the point $x$ , for $i = 1, 2, \dots, n$ and $j = 1, 2, \dots, n$ . When IFLAG = 0 or 1, FJAC must not be changed.	
	<i>On exit:</i> if IFLAG = 2 on entry, FJAC( $i,j$ ) must contain the value of $\frac{\partial f_i}{\partial x_j}$ at the point $x$ , for $i = 1, 2, \dots, n$ and $j = 1, 2, \dots, n$ , (unless IFLAG is set to a negative value by FCN).	
5:	IUSER(*) – INTEGER array	<i>User Workspace</i>
6:	RUSER(*) – REAL (KIND=nag_wp) array	<i>User Workspace</i>
	FCN is called with the arguments IUSER and RUSER as supplied to C05RCF. You should use the arrays IUSER and RUSER to supply information to FCN.	
7:	IFLAG – INTEGER	<i>Input/Output</i>
	<i>On entry:</i> IFLAG = 0, 1 or 2.	
	IFLAG = 0 X, FVEC and FJAC are available for printing (see NPRINT).	
	IFLAG = 1 FVEC is to be updated.	
	IFLAG = 2 FJAC is to be updated.	
	<i>On exit:</i> in general, IFLAG should not be reset by FCN. If, however, you wish to terminate execution (perhaps because some illegal point X has been reached), then IFLAG should be set to a negative integer value.	

FCN must either be a module subprogram USED by, or declared as EXTERNAL in, the (sub) program from which C05RCF is called. Arguments denoted as *Input* must **not** be changed by this procedure.

2:	N – INTEGER	<i>Input</i>
	<i>On entry:</i> $n$ , the number of equations.	
	<i>Constraint:</i> $N > 0$ .	
3:	X(N) – REAL (KIND=nag_wp) array	<i>Input/Output</i>
	<i>On entry:</i> an initial guess at the solution vector.	
	<i>On exit:</i> the final estimate of the solution vector.	

- 4: FVEC(N) – REAL (KIND=nag\_wp) array *Output*  
*On exit:* the function values at the final point returned in X.
- 5: FJAC(N,N) – REAL (KIND=nag\_wp) array *Output*  
*On exit:* the orthogonal matrix  $Q$  produced by the  $QR$  factorization of the final approximate Jacobian.
- 6: XTOL – REAL (KIND=nag\_wp) *Input*  
*On entry:* the accuracy in X to which the solution is required.  
*Suggested value:*  $\sqrt{\epsilon}$ , where  $\epsilon$  is the **machine precision** returned by X02AJF.  
*Constraint:* XTOL  $\geq$  0.0.
- 7: MAXFEV – INTEGER *Input*  
*On entry:* the maximum number of calls to FCN with IFLAG  $\neq$  0. C05RCF will exit with IFAIL = 2, if, at the end of an iteration, the number of calls to FCN exceeds MAXFEV.  
*Suggested value:* MAXFEV = 100  $\times$  (N + 1).  
*Constraint:* MAXFEV > 0.
- 8: MODE – INTEGER *Input*  
*On entry:* indicates whether or not you have provided scaling factors in DIAG.  
If MODE = 2 the scaling must have been specified in DIAG.  
Otherwise, if MODE = 1, the variables will be scaled internally.  
*Constraint:* MODE = 1 or 2.
- 9: DIAG(N) – REAL (KIND=nag\_wp) array *Input/Output*  
*On entry:* if MODE = 2, DIAG must contain multiplicative scale factors for the variables.  
If MODE = 1, DIAG need not be set.  
*Constraint:* if MODE = 2, DIAG( $i$ ) > 0.0, for  $i = 1, 2, \dots, n$ .  
*On exit:* the scale factors actually used (computed internally if MODE = 1).
- 10: FACTOR – REAL (KIND=nag\_wp) *Input*  
*On entry:* a quantity to be used in determining the initial step bound. In most cases, FACTOR should lie between 0.1 and 100.0. (The step bound is FACTOR  $\times$   $\|\text{DIAG} \times X\|_2$  if this is nonzero; otherwise the bound is FACTOR.)  
*Suggested value:* FACTOR = 100.0.  
*Constraint:* FACTOR > 0.0.
- 11: NPRINT – INTEGER *Input*  
*On entry:* indicates whether (and how often) special calls to FCN, with IFLAG set to 0, are to be made for printing purposes.  
NPRINT  $\leq$  0  
No calls are made.  
NPRINT > 0  
FCN is called at the beginning of the first iteration, every NPRINT iterations thereafter and immediately before the return from C05RCF.

- 12: NFEV – INTEGER *Output*  
*On exit:* the number of calls made to FCN to evaluate the functions.
- 13: NJEV – INTEGER *Output*  
*On exit:* the number of calls made to FCN to evaluate the Jacobian.
- 14:  $R(N \times (N + 1)/2)$  – REAL (KIND=nag\_wp) array *Output*  
*On exit:* the upper triangular matrix  $R$  produced by the  $QR$  factorization of the final approximate Jacobian, stored row-wise.
- 15: QTF(N) – REAL (KIND=nag\_wp) array *Output*  
*On exit:* the vector  $Q^T f$ .
- 16: IUSER(\*) – INTEGER array *User Workspace*  
 17: RUSER(\*) – REAL (KIND=nag\_wp) array *User Workspace*  
 IUSER and RUSER are not used by C05RCF, but are passed directly to FCN and should be used to pass information to this routine.
- 18: IFAIL – INTEGER *Input/Output*  
*On entry:* IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this argument you should refer to Section 3.4 in How to Use the NAG Library and its Documentation for details.  
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this argument, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**  
*On exit:* IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 2

There have been at least MAXFEV calls to FCN: MAXFEV =  $\langle value \rangle$ . Consider restarting the calculation from the final point held in X.

IFAIL = 3

No further improvement in the solution is possible. XTOL is too small: XTOL =  $\langle value \rangle$ .

IFAIL = 4

The iteration is not making good progress, as measured by the improvement from the last  $\langle value \rangle$  Jacobian evaluations. This failure exit may indicate that the system does not have a zero, or that the solution is very close to the origin (see Section 7). Otherwise, rerunning C05RCF from a different starting point may avoid the region of difficulty.

IFAIL = 5

The iteration is not making good progress, as measured by the improvement from the last  $\langle value \rangle$  iterations. This failure exit may indicate that the system does not have a zero, or that the solution is very close to the origin (see Section 7). Otherwise, rerunning C05RCF from a different starting point may avoid the region of difficulty.

IFAIL = 6

IFLAG was set negative in FCN. IFLAG =  $\langle value \rangle$ .

IFAIL = 11

On entry, N =  $\langle value \rangle$ .  
Constraint: N > 0.

IFAIL = 12

On entry, XTOL =  $\langle value \rangle$ .  
Constraint: XTOL  $\geq$  0.0.

IFAIL = 13

On entry, MODE =  $\langle value \rangle$ .  
Constraint: MODE = 1 or 2.

IFAIL = 14

On entry, FACTOR =  $\langle value \rangle$ .  
Constraint: FACTOR > 0.0.

IFAIL = 15

On entry, MODE = 2 and DIAG contained a non-positive element.

IFAIL = 18

On entry, MAXFEV =  $\langle value \rangle$ .  
Constraint: MAXFEV > 0.

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.9 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.

See Section 3.8 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.7 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

If  $\hat{x}$  is the true solution and  $D$  denotes the diagonal matrix whose entries are defined by the array DIAG, then C05RCF tries to ensure that

$$\|D(x - \hat{x})\|_2 \leq \text{XTOL} \times \|D\hat{x}\|_2.$$

If this condition is satisfied with  $\text{XTOL} = 10^{-k}$ , then the larger components of  $Dx$  have  $k$  significant

decimal digits. There is a danger that the smaller components of  $Dx$  may have large relative errors, but the fast rate of convergence of C05RCF usually obviates this possibility.

If XTOL is less than *machine precision* and the above test is satisfied with the *machine precision* in place of XTOL, then the routine exits with IFAIL = 3.

**Note:** this convergence test is based purely on relative error, and may not indicate convergence if the solution is very close to the origin.

The convergence test assumes that the functions and the Jacobian are coded consistently and that the functions are reasonably well behaved. If these conditions are not satisfied, then C05RCF may incorrectly indicate convergence. The coding of the Jacobian can be checked using C05ZDF. If the Jacobian is coded correctly, then the validity of the answer can be checked by rerunning C05RCF with a lower value for XTOL.

## 8 Parallelism and Performance

C05RCF is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

C05RCF makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

Local workspace arrays of fixed lengths are allocated internally by C05RCF. The total size of these arrays amounts to  $4 \times n$  real elements.

The time required by C05RCF to solve a given problem depends on  $n$ , the behaviour of the functions, the accuracy requested and the starting point. The number of arithmetic operations executed by C05RCF is approximately  $11.5 \times n^2$  to process each evaluation of the functions and approximately  $1.3 \times n^3$  to process each evaluation of the Jacobian. The timing of C05RCF is strongly influenced by the time spent evaluating the functions.

Ideally the problem should be scaled so that, at the solution, the function values are of comparable magnitude.

## 10 Example

This example determines the values  $x_1, \dots, x_9$  which satisfy the tridiagonal equations:

$$\begin{aligned} (3 - 2x_1)x_1 - 2x_2 &= -1, \\ -x_{i-1} + (3 - 2x_i)x_i - 2x_{i+1} &= -1, \quad i = 2, 3, \dots, 8 \\ -x_8 + (3 - 2x_9)x_9 &= -1. \end{aligned}$$
