

NAG Library Routine Document

G01DAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

G01DAF computes a set of Normal scores, i.e., the expected values of an ordered set of independent observations from a Normal distribution with mean 0.0 and standard deviation 1.0.

2 Specification

```
SUBROUTINE G01DAF (N, PP, ETOL, ERREST, WORK, IW, IFAIL)
INTEGER          N, IW, IFAIL
REAL (KIND=nag_wp) PP(N), ETOL, ERREST, WORK(IW)
```

3 Description

If a sample of n observations from any distribution (which may be denoted by x_1, x_2, \dots, x_n), is sorted into ascending order, the r th smallest value in the sample is often referred to as the r th '**order statistic**', sometimes denoted by $x_{(r)}$ (see Kendall and Stuart (1969)).

The order statistics therefore have the property

$$x_{(1)} \leq x_{(2)} \leq \dots \leq x_{(n)}.$$

(If $n = 2r + 1$, x_{r+1} is the sample median.)

For samples originating from a known distribution, the distribution of each order statistic in a sample of given size may be determined. In particular, the expected values of the order statistics may be found by integration. If the sample arises from a Normal distribution, the expected values of the order statistics are referred to as the '**Normal scores**'. The Normal scores provide a set of reference values against which the order statistics of an actual data sample of the same size may be compared, to provide an indication of Normality for the sample (see G01AHF). Normal scores have other applications; for instance, they are sometimes used as alternatives to ranks in nonparametric testing procedures.

G01DAF computes the r th Normal score for a given sample size n as

$$E(x_{(r)}) = \int_{-\infty}^{\infty} x_r dG_r,$$

where

$$dG_r = \frac{A_r^{r-1}(1 - A_r)^{n-r} dA_r}{\beta(r, n - r + 1)}, \quad A_r = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x_r} e^{-t^2/2} dt, \quad r = 1, 2, \dots, n,$$

and β denotes the complete beta function.

The routine attempts to evaluate the scores so that the estimated error in each score is less than the value ETOL specified by you. All integrations are performed in parallel and arranged so as to give good speed and reasonable accuracy.

5 Arguments

- 1: N – INTEGER *Input*
On entry: n , the size of the set.
Constraint: $N > 0$.
- 2: PP(N) – REAL (KIND=nag_wp) array *Output*
On exit: the Normal scores. PP(i) contains the value $E(x_{(i)})$, for $i = 1, 2, \dots, n$.
- 3: ETOL – REAL (KIND=nag_wp) *Input*
On entry: the maximum value for the estimated absolute error in the computed scores.
Constraint: ETOL > 0.0.
- 4: ERREST – REAL (KIND=nag_wp) *Output*
On exit: a computed estimate of the maximum error in the computed scores (see Section 7).
- 5: WORK(IW) – REAL (KIND=nag_wp) array *Workspace*
 6: IW – INTEGER *Input*
On entry: the dimension of the array WORK as declared in the (sub)program from which G01DAF is called.
Constraints:
 if N must be even, $IW \geq 3 \times N/2$;
 otherwise $IW \geq 3 \times (N - 1)/2$.
- 7: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this argument you should refer to Section 3.4 in How to Use the NAG Library and its Documentation for details.
 For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this argument, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**
On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $N < 1$.

IFAIL = 2

On entry, $ETOL \leq 0.0$.

IFAIL = 3

The routine was unable to estimate the scores with estimated error less than ETOL. The best result obtained is returned together with the associated value of ERREST.

IFAIL = 4

On entry, if N is even, $IW < 3 \times N/2$;
or if N is odd, $IW < 3 \times (N - 1)/2$.

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.9 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.

See Section 3.8 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.7 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

Errors are introduced by evaluation of the functions dG_r and errors in the numerical integration process. Errors are also introduced by the approximation of the true infinite range of integration by a finite range $[a, b]$ but a and b are chosen so that this effect is of lower order than that of the other two factors. In order to estimate the maximum error the functions dG_r are also integrated over the range $[a, b]$. G01DAF returns the estimated maximum error as

$$\text{ERREST} = \max_r \left[\max(|a|, |b|) \times \left| \int_a^b dG_r - 1.0 \right| \right].$$

8 Parallelism and Performance

G01DAF is not threaded in any implementation.

9 Further Comments

The time taken by G01DAF depends on ETOL and N. For a given value of ETOL the timing varies approximately linearly with N.

10 Example

The program below generates the Normal scores for samples of size 5, 10, 15, and prints the scores and the computed error estimates.

10.1 Program Text

```

Program g01dafa

10.2 Program Data

None.

10.3 Program Results

G01DAF Example Program Results

```

Set size = 15
Error tolerance (input) =      0.100E-02
Error estimate (output) =      0.222E-07
Normal scores
      -1.736   -1.248   -0.948   -0.715   -0.516
      -0.335   -0.165    0.000    0.165    0.335
       0.516    0.715    0.948    1.248    1.736

```

This shows a Q-Q plot for a randomly generated set of data. The normal scores have been calculated using G01DAF and the sample quantiles obtained by sorting the observed data using M01CAF. A reference line at $y = x$ is also shown.
