

# NAG Library Routine Document

## G05XEF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

G05XEF takes a set of input times and permutes them to specify one of several predefined Brownian bridge construction orders. The permuted times can be passed to G05XAF or G05XCF to initialize the Brownian bridge generators with the chosen bridge construction order.

### 2 Specification

```
SUBROUTINE G05XEF (BGORD, TO, TEND, NTIMES, INTIME, NMOVE, MOVE, TIMES, &
                  IFAIL)
```

```
INTEGER          BGORD, NTIMES, NMOVE, MOVE(NMOVE), IFAIL
REAL (KIND=nag_wp) TO, TEND, INTIME(NTIMES), TIMES(NTIMES)
```

### 3 Description

The Brownian bridge algorithm (see Glasserman (2004)) is a popular method for constructing a Wiener process at a set of discrete times,  $t_0 < t_1 < t_2 < \dots < t_N < T$ , for  $N \geq 1$ . To ease notation we assume that  $T$  has the index  $N + 1$  so that  $T = t_{N+1}$ . Inherent in the algorithm is the notion of a *bridge construction order* which specifies the order in which the  $N + 2$  points of the Wiener process,  $X_{t_0}, X_T$  and  $X_{t_i}$ , for  $i = 1, 2, \dots, N$ , are generated. The value of  $X_{t_0}$  is always assumed known, and the first point to be generated is always the final time  $X_T$ . Thereafter, successive points are generated iteratively by an interpolation formula, using points which were computed at previous iterations. In many cases the bridge construction order is not important, since any construction order will yield a correct process. However, in certain cases, for example when using quasi-random variates to construct the sample paths, the bridge construction order can be important.

#### 3.1 Supported Bridge Construction Orders

G05XEF accepts as input an array of time points  $t_1, t_2, \dots, t_N, T$  at which the Wiener process is to be sampled. These time points are then permuted to construct the bridge. In all of the supported construction orders the first construction point is  $T$  which has index  $N + 1$ . The remaining points are constructed by iteratively bisecting (sub-intervals of) the *time indices* interval  $[0, N + 1]$ , as Figure 1 illustrates:

**Figure 1**

The time indices interval is processed in levels  $L^i$ , for  $i = 1, 2, \dots$ . Each level  $L^i$  contains  $n_i$  points  $L^i_1, \dots, L^i_{n_i}$  where  $n_i \leq 2^{i-1}$ . The number of points at each level depends on the value of  $N$ . The points

$L_j^i$  for  $i \geq 1$  and  $j = 1, 2, \dots, n_i$  are computed as follows: define  $L_0^0 = N + 1$  and set

$$L_j^i = J + (K - J)/2 \quad \text{where}$$

$$J = \max \left\{ L_k^p : 1 \leq k \leq n_p, 0 \leq p < i \text{ and } L_k^p < L_j^i \right\} \quad \text{and}$$

$$K = \min \left\{ L_k^p : 1 \leq k \leq n_p, 0 \leq p < i \text{ and } L_k^p > L_j^i \right\}$$

By convention the maximum of the empty set is taken to be zero. Figure 1 illustrates the algorithm when  $N + 1$  is a power of two. When  $N + 1$  is not a power of two, one must decide how to round the divisions by 2. For example, if one rounds down to the nearest integer, then one could get the following:

Figure 2

From the series of bisections outlined above, two ways of ordering the time indices  $L_j^i$  are supported. In both cases, levels are always processed from coarsest to finest (i.e., increasing  $i$ ). Within a level, the time indices can either be processed left to right (i.e., increasing  $j$ ) or right to left (i.e., decreasing  $j$ ). For example, when processing left to right, the sequence of time indices could be generated as:

$$N + 1 \quad L_1^1 \quad L_1^2 \quad L_2^2 \quad L_1^3 \quad L_2^3 \quad L_3^3 \quad L_4^3 \quad \dots$$

while when processing right to left, the same sequence would be generated as:

$$N + 1 \quad L_1^1 \quad L_2^2 \quad L_1^2 \quad L_4^3 \quad L_3^3 \quad L_2^3 \quad L_1^3 \quad \dots$$

G05XEF therefore offers four bridge construction methods; processing either left to right or right to left, with rounding either up or down. Which method is used is controlled by the BGORD argument. For example, on the set of times

$$t_1 \quad t_2 \quad t_3 \quad t_4 \quad t_5 \quad t_6 \quad t_7 \quad t_8 \quad t_9 \quad t_{10} \quad t_{11} \quad t_{12} \quad T$$

the Brownian bridge would be constructed in the following orders:

BGORD = 1 (processing left to right, rounding down)

$$T \quad t_6 \quad t_3 \quad t_9 \quad t_1 \quad t_4 \quad t_7 \quad t_{11} \quad t_2 \quad t_5 \quad t_8 \quad t_{10} \quad t_{12}$$

BGORD = 2 (processing left to right, rounding up)

$$T \quad t_7 \quad t_4 \quad t_{10} \quad t_2 \quad t_6 \quad t_9 \quad t_{12} \quad t_1 \quad t_3 \quad t_5 \quad t_8 \quad t_{11}$$

BGORD = 3 (processing right to left, rounding down)

$$T \quad t_6 \quad t_9 \quad t_3 \quad t_{11} \quad t_7 \quad t_4 \quad t_1 \quad t_{12} \quad t_{10} \quad t_8 \quad t_5 \quad t_2$$

BGORD = 4 (processing right to left, rounding up)

$$T \quad t_7 \quad t_{10} \quad t_4 \quad t_{12} \quad t_9 \quad t_6 \quad t_2 \quad t_{11} \quad t_8 \quad t_5 \quad t_3 \quad t_1$$

The four construction methods described above can be further modified through the use of the input array MOVE. To see the effect of this argument, suppose that an array  $A$  holds the output of G05XEF when NMOVE = 0 (i.e., the bridge construction order as specified by BGORD only). Let

$$B = \{t_j : j = \text{MOVE}(i), i = 1, 2, \dots, \text{NMOVE}\}$$

be the array of all times identified by MOVE, and let  $C$  be the array  $A$  with all the elements in  $B$  removed, i.e.,

$$C = \{A(i) : A(i) \neq B(j), i = 1, 2, \dots, \text{NTIMES}, j = 1, 2, \dots, \text{NMOVE}\}.$$

Then the output of G05XEF when  $\text{NMOVE} > 0$  is given by

$$B(1) \ B(2) \ \dots \ B(\text{NMOVE}) \ C(1) \ C(2) \ \dots \ C(\text{NTIMES} - \text{NMOVE})$$

When the Brownian bridge is used with quasi-random variates, this functionality can be used to allow specific sections of the bridge to be constructed using the lowest dimensions of the quasi-random points.

## 4 References

Glasserman P (2004) *Monte Carlo Methods in Financial Engineering* Springer

## 5 Arguments

- 1: BGORD – INTEGER *Input*  
*On entry:* the bridge construction order to use.  
*Constraint:* BGORD = 1, 2, 3 or 4.
- 2: T0 – REAL (KIND=nag\_wp) *Input*  
*On entry:*  $t_0$ , the start value of the time interval on which the Wiener process is to be constructed.
- 3: TEND – REAL (KIND=nag\_wp) *Input*  
*On entry:*  $T$ , the largest time at which the Wiener process is to be constructed.
- 4: NTIMES – INTEGER *Input*  
*On entry:*  $N$ , the number of time points in the Wiener process, excluding  $t_0$  and  $T$ .  
*Constraint:* NTIMES  $\geq$  1.
- 5: INTIME(NTIMES) – REAL (KIND=nag\_wp) array *Input*  
*On entry:* the time points,  $t_1, t_2, \dots, t_N$ , at which the Wiener process is to be constructed. Note that the final time  $T$  is not included in this array.  
*Constraints:*  
 $T_0 < \text{INTIME}(i)$  and  $\text{INTIME}(i) < \text{INTIME}(i + 1)$ , for  $i = 1, 2, \dots, \text{NTIMES} - 1$ ;  
 $\text{INTIME}(\text{NTIMES}) < \text{TEND}$ .
- 6: NMOVE – INTEGER *Input*  
*On entry:* the number of elements in the array MOVE.  
*Constraint:*  $0 \leq \text{NMOVE} \leq \text{NTIMES}$ .
- 7: MOVE(NMOVE) – INTEGER array *Input*  
*On entry:* the indices of the entries in INTIME which should be moved to the front of the TIMES array, with  $\text{MOVE}(j) = i$  setting the  $j$ th element of TIMES to  $t_i$ . Note that  $i$  ranges from 1 to NTIMES. When  $\text{NMOVE} = 0$ , MOVE is not referenced.  
*Constraint:*  $1 \leq \text{MOVE}(j) \leq \text{NTIMES}$ , for  $j = 1, 2, \dots, \text{NMOVE}$ .  
The elements of MOVE must be unique.

8: TIMES(NTIMES) – REAL (KIND=nag\_wp) array *Output*  
*On exit:* the output bridge construction order. This should be passed to G05XAF or G05XCF.

9: IFAIL – INTEGER *Input/Output*  
*On entry:* IFAIL must be set to 0, –1 or 1. If you are unfamiliar with this argument you should refer to Section 3.4 in How to Use the NAG Library and its Documentation for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value –1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this argument, the recommended value is 0. **When the value –1 or 1 is used it is essential to test the value of IFAIL on exit.**

*On exit:* IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or –1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, BGORD =  $\langle value \rangle$ .  
 Constraint: BGORD = 1, 2, 3 or 4

IFAIL = 2

On entry, NTIMES =  $\langle value \rangle$ .  
 Constraint: NTIMES  $\geq$  1.

IFAIL = 3

On entry, NMOVE =  $\langle value \rangle$  and NTIMES =  $\langle value \rangle$ .  
 Constraint:  $0 \leq$  NMOVE  $\leq$  NTIMES.

IFAIL = 4

On entry, INTIME( $\langle value \rangle$ ) =  $\langle value \rangle$  and INTIME( $\langle value \rangle$ ) =  $\langle value \rangle$ .  
 Constraint: the elements in INTIME must be in increasing order.

On entry, INTIME(1) =  $\langle value \rangle$  and T0 =  $\langle value \rangle$ .  
 Constraint: INTIME(1) > T0.

On entry, NTIMES =  $\langle value \rangle$ , INTIME(NTIMES) =  $\langle value \rangle$  and TEND =  $\langle value \rangle$ .  
 Constraint: INTIME(NTIMES) < TEND.

IFAIL = 5

On entry, MOVE( $\langle value \rangle$ ) =  $\langle value \rangle$ .  
 Constraint: MOVE( $i$ )  $\geq$  1 for all  $i$ .

On entry, MOVE( $\langle value \rangle$ ) =  $\langle value \rangle$  and NTIMES =  $\langle value \rangle$ .  
 Constraint: MOVE( $i$ )  $\leq$  NTIMES for all  $i$ .

IFAIL = 6

On entry, MOVE( $\langle value \rangle$ ) and MOVE( $\langle value \rangle$ ) both equal  $\langle value \rangle$ .  
 Constraint: all elements in MOVE must be unique.

IFAIL = -99

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.9 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -399

Your licence key may have expired or may not have been installed correctly.

See Section 3.8 in How to Use the NAG Library and its Documentation for further information.

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.7 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

Not applicable.

## 8 Parallelism and Performance

G05XEF is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

None.

## 10 Example

This example calls G05XEF, G05XAF and G05XBF to generate two sample paths of a three-dimensional free Wiener process. The array MOVE is used to ensure that a certain part of the sample path is always constructed using the lowest dimensions of the input quasi-random points. For further details on using quasi-random points with the Brownian bridge algorithm, please see Section 2.6 in the G05 Chapter Introduction.
