### nag\_inteq\_abel\_weak\_weights (d05byc)

#### 1 Purpose

nag\_inteq\_abel\_weak\_weights (d05byc) computes the fractional quadrature weights associated with the Backward Differentiation Formulae (BDF) of orders 4, 5 and 6. These weights can then be used in the solution of weakly singular equations of Abel type.

#### 2 Specification

```
#include <nag.h>
#include <nagd05.h>

void nag_inteq_abel_weak_weights (Integer iorder, Integer iq,
    double omega[], double sw[], NagError *fail)
```

#### 3 Description

nag\_inteq\_abel\_weak\_weights (d05byc) computes the weights  $W_{i,j}$  and  $\omega_i$  for a family of quadrature rules related to a BDF method for approximating the integral:

$$\frac{1}{\sqrt{\pi}} \int_0^t \frac{\phi(s)}{\sqrt{t-s}} ds \simeq \sqrt{h} \sum_{j=0}^{2p-2} W_{i,j} \phi(j \times h) + \sqrt{h} \sum_{j=2p-1}^i \omega_{i-j} \phi(j \times h), \quad 0 \leq t \leq T, \quad (1)$$

with  $t = i \times h$  ( $i \geq 0$ ), for some given  $h$ . In (1),  $p$  is the order of the BDF method used and  $W_{i,j}$ ,  $\omega_i$  are the fractional starting and the fractional convolution weights respectively. The algorithm for the generation of  $\omega_i$  is based on Newton's iteration. Fast Fourier transform (FFT) techniques are used for computing these weights and subsequently  $W_{i,j}$  (see Baker and Derakhshan (1987) and Henrici (1979) for practical details and Lubich (1986) for theoretical details). Some special functions can be represented as the fractional integrals of simpler functions and fractional quadratures can be employed for their computation (see Lubich (1986)). A description of how these weights can be used in the solution of weakly singular equations of Abel type is given in Section 9.

#### 5 Arguments

1: **iorder** – Integer *Input*

*On entry:*  $p$ , the order of the BDF method to be used.

*Constraint:*  $4 \leq \mathbf{iorder} \leq 6$ .

2: **iq** – Integer *Input*

*On entry:* determines the number of weights to be computed. By setting **iq** to a value,  $2^{\mathbf{iq}+1}$  fractional convolution weights are computed.

*Constraint:*  $\mathbf{iq} \geq 0$ .

- 3: **omega**[ $2^{iq+2}$ ] – double *Output*  
*On exit:* the first  $2^{iq+1}$  elements of **omega** contains the fractional convolution weights  $\omega_i$ , for  $i = 0, 1, \dots, 2^{iq+1} - 1$ . The remainder of the array is used as workspace.
- 4: **sw**[ $N \times (2 \times \mathbf{iorder} - 1)$ ] – double *Output*  
**Note:** the  $(i, j)$ th element of the matrix is stored in **sw**[( $j - 1$ )  $\times N + i - 1$ ].  
*On exit:* **sw**[ $j \times N + i - 1$ ] contains the fractional starting weights  $W_{i,j}$ , for  $i = 1, 2, \dots, N$  and  $j = 0, 1, \dots, 2 \times \mathbf{iorder} - 2$ , where  $N = (2^{iq+1} + 2 \times \mathbf{iorder} - 1)$ .
- 5: **fail** – NagError \* *Input/Output*  
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry, **iorder** =  $\langle value \rangle$ .

Constraint:  $4 \leq \mathbf{iorder} \leq 6$ .

On entry, **iq** =  $\langle value \rangle$ .

Constraint: **iq**  $\geq 0$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

Not applicable.

## 8 Parallelism and Performance

nag\_inteq\_abel\_weak\_weights (d05byc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_inteq\_abel\_weak\_weights (d05byc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

Fractional quadrature weights can be used for solving weakly singular integral equations of Abel type. In this section, we propose the following algorithm which you may find useful in solving a linear weakly singular integral equation of the form

$$y(t) = f(t) + \frac{1}{\sqrt{\pi}} \int_0^t \frac{K(t,s)y(s)}{\sqrt{t-s}} ds, \quad 0 \leq t \leq T, \quad (2)$$

using `nag_inteq_abel_weak_weights` (d05byc). In (2),  $K(t,s)$  and  $f(t)$  are given and the solution  $y(t)$  is sought on a uniform mesh of size  $h$  such that  $T = N \times h$ . Discretization of (2) yields

$$y_i = f(i \times h) + \sqrt{h} \sum_{j=0}^{2p-2} W_{i,j} K(i \times h, j \times h) y_j + \sqrt{h} \sum_{j=2p-1}^i \omega_{i-j} K(i \times h, j \times h) y_j, \quad (3)$$

where  $y_i \simeq y(i \times h)$ , for  $i = 1, 2, \dots, N$ . We propose the following algorithm for computing  $y_i$  from (3) after a call to `nag_inteq_abel_weak_weights` (d05byc):

- (a) Set  $N = 2^{i_q+1} + 2 \times \mathbf{iorder} - 2$  and  $h = T/N$ .
- (b) Equation (3) requires  $2 \times \mathbf{iorder} - 2$  starting values,  $y_j$ , for  $j = 1, 2, \dots, 2 \times \mathbf{iorder} - 2$ , with  $y_0 = f(0)$ . These starting values can be computed by solving the system

$$y_i = f(i \times h) + \sqrt{h} \sum_{j=0}^{2 \times \mathbf{iorder} - 2} \mathbf{sw}[j \times N + i] K(i \times h, j \times h) y_j, \quad i = 1, 2, \dots, 2 \times \mathbf{iorder} - 2.$$

- (c) Compute the inhomogeneous terms

$$\sigma_i = f(i \times h) + \sqrt{h} \sum_{j=0}^{2 \times \mathbf{iorder} - 2} \mathbf{sw}[j \times N + i] K(i \times h, j \times h) y_j, \quad i = 2 \times \mathbf{iorder} - 1, 2 \times \mathbf{iorder}, \dots, N.$$

- (d) Start the iteration for  $i = 2 \times \mathbf{iorder} - 1, 2 \times \mathbf{iorder}, \dots, N$  to compute  $y_i$  from:

$$\left(1 - \sqrt{h} \mathbf{omega}[0] K(i \times h, i \times h)\right) y_i = \sigma_i + \sqrt{h} \sum_{j=2 \times \mathbf{iorder} - 1}^{i-1} \mathbf{omega}[i - j] K(i \times h, j \times h) y_j.$$

Note that for nonlinear weakly singular equations, the solution of a nonlinear algebraic system is required at step (b) and a single nonlinear equation at step (d).

## 10 Example

The following example generates the first 16 fractional convolution and 23 fractional starting weights generated by the fourth-order BDF method.
