## nag\_4d\_shep\_interp (e01tkc)

### 1 Purpose

nag\_4d\_shep\_interp (e01tkc) generates a four-dimensional interpolant to a set of scattered data points, using a modified Shepard method.

### 2 Specification

```
#include <nag.h>
#include <nage01.h>

void nag_4d_shep_interp (Integer m, const double x[], const double f[],
                        Integer nw, Integer nq, Integer iq[], double rq[], NagError *fail)
```

### 3 Description

nag\_4d\_shep\_interp (e01tkc) constructs a smooth function  $Q(\mathbf{x})$ ,  $\mathbf{x} \in \mathbb{R}^4$  which interpolates a set of  $m$  scattered data points  $(\mathbf{x}_r, f_r)$ , for  $r = 1, 2, \dots, m$ , using a modification of Shepard's method. The surface is continuous and has continuous first partial derivatives.

The basic Shepard method, which is a generalization of the two-dimensional method described in Shepard (1968), interpolates the input data with the weighted mean

$$Q(\mathbf{x}) = \frac{\sum_{r=1}^m w_r(\mathbf{x}) q_r}{\sum_{r=1}^m w_r(\mathbf{x})},$$

where  $q_r = f_r$ ,  $w_r(\mathbf{x}) = \frac{1}{d_r^2}$  and  $d_r^2 = \|\mathbf{x} - \mathbf{x}_r\|_2^2$ .

The basic method is global in that the interpolated value at any point depends on all the data, but nag\_4d\_shep\_interp (e01tkc) uses a modification (see Franke and Nielson (1980) and Renka (1988a)), whereby the method becomes local by adjusting each  $w_r(\mathbf{x})$  to be zero outside a hypersphere with centre  $\mathbf{x}_r$  and some radius  $R_w$ . Also, to improve the performance of the basic method, each  $q_r$  above is replaced by a function  $q_r(\mathbf{x})$ , which is a quadratic fitted by weighted least squares to data local to  $\mathbf{x}_r$  and forced to interpolate  $(\mathbf{x}_r, f_r)$ . In this context, a point  $\mathbf{x}$  is defined to be local to another point if it lies within some distance  $R_q$  of it.

The efficiency of nag\_4d\_shep\_interp (e01tkc) is enhanced by using a cell method for nearest neighbour searching due to Bentley and Friedman (1979) with a cell density of 3.

The radii  $R_w$  and  $R_q$  are chosen to be just large enough to include  $N_w$  and  $N_q$  data points, respectively, for user-supplied constants  $N_w$  and  $N_q$ . Default values of these arguments are provided by the function, and advice on alternatives is given in Section 9.2.

nag\_4d\_shep\_interp (e01tkc) is derived from the new implementation of QSHEP3 described by Renka (1988b). It uses the modification for high-dimensional interpolation described by Berry and Minser (1999).

Values of the interpolant  $Q(\mathbf{x})$  generated by nag\_4d\_shep\_interp (e01tkc), and its first partial derivatives, can subsequently be evaluated for points in the domain of the data by a call to nag\_4d\_shep\_eval (e01tkc).

## 5 Arguments

- 1: **m** – Integer *Input*  
*On entry:*  $m$ , the number of data points.  
*Constraint:*  $\mathbf{m} \geq 16$ .
- 2: **x**[ $4 \times \mathbf{m}$ ] – const double *Input*  
**Note:** the  $(i, j)$ th element of the matrix  $X$  is stored in  $\mathbf{x}[(j - 1) \times 4 + i - 1]$ .  
*On entry:*  $\mathbf{x}[(r - 1) \times 4], \dots, \mathbf{x}[(r - 1) \times 4 + 3]$  must be set to the Cartesian coordinates of the data point  $\mathbf{x}_r$ , for  $r = 1, 2, \dots, m$ .  
*Constraint:* these coordinates must be distinct, and must not all lie on the same three-dimensional hypersurface.
- 3: **f**[ $\mathbf{m}$ ] – const double *Input*  
*On entry:*  $\mathbf{f}[r - 1]$  must be set to the data value  $f_r$ , for  $r = 1, 2, \dots, m$ .
- 4: **nw** – Integer *Input*  
*On entry:* the number  $N_w$  of data points that determines each radius of influence  $R_w$ , appearing in the definition of each of the weights  $w_r$ , for  $r = 1, 2, \dots, m$  (see Section 3). Note that  $R_w$  is different for each weight. If  $\mathbf{nw} \leq 0$  the default value  $\mathbf{nw} = \min(32, \mathbf{m} - 1)$  is used instead.  
*Constraint:*  $\mathbf{nw} \leq \min(50, \mathbf{m} - 1)$ .
- 5: **nq** – Integer *Input*  
*On entry:* the number  $N_q$  of data points to be used in the least squares fit for coefficients defining the quadratic functions  $q_r(\mathbf{x})$  (see Section 3). If  $\mathbf{nq} \leq 0$  the default value  $\mathbf{nq} = \min(38, \mathbf{m} - 1)$  is used instead.  
*Constraint:*  $\mathbf{nq} \leq 0$  or  $14 \leq \mathbf{nq} \leq \min(50, \mathbf{m} - 1)$ .
- 6: **iq**[ $2 \times \mathbf{m} + 1$ ] – Integer *Output*  
*On exit:* integer data defining the interpolant  $Q(\mathbf{x})$ .
- 7: **rq**[ $15 \times \mathbf{m} + 9$ ] – double *Output*  
*On exit:* real data defining the interpolant  $Q(\mathbf{x})$ .

8: **fail** – NagError \*

*Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_DATA\_HYPERSURFACE

On entry, all the data points lie on the same three-dimensional hypersurface. No unique solution exists.

### NE\_DUPLICATE\_NODE

There are duplicate nodes in the dataset.  $\mathbf{x}[(k-1) \times 4 + i - 1] = \mathbf{x}[(k-1) \times 4 + j - 1]$ , for  $i = \langle value \rangle$ ,  $j = \langle value \rangle$  and  $k = 1, 2, \dots, 4$ . The interpolant cannot be derived.

### NE\_INT

On entry,  $\mathbf{m} = \langle value \rangle$ .

Constraint:  $\mathbf{m} \geq 16$ .

On entry,  $\mathbf{nq} = \langle value \rangle$ .

Constraint:  $\mathbf{nq} \leq 0$  or  $\mathbf{nq} \geq 14$ .

### NE\_INT\_2

On entry,  $\mathbf{nq} = \langle value \rangle$  and  $\mathbf{m} = \langle value \rangle$ .

Constraint:  $\mathbf{nq} \leq \min(50, \mathbf{m} - 1)$ .

On entry,  $\mathbf{nw} = \langle value \rangle$  and  $\mathbf{m} = \langle value \rangle$ .

Constraint:  $\mathbf{nw} \leq \min(50, \mathbf{m} - 1)$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

On successful exit, the function generated interpolates the input data exactly and has quadratic precision. Overall accuracy of the interpolant is affected by the choice of arguments  $\mathbf{nw}$  and  $\mathbf{nq}$  as well as the smoothness of the function represented by the input data.

## 8 Parallelism and Performance

nag\_4d\_shep\_interp (e01tkc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_4d\_shep\_interp (e01tkc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

### 9.1 Timing

The time taken for a call to nag\_4d\_shep\_interp (e01tkc) will depend in general on the distribution of the data points and on the choice of  $N_w$  and  $N_q$  parameters. If the data points are uniformly randomly distributed, then the time taken should be  $O(m)$ . At worst  $O(m^2)$  time will be required.

### 9.2 Choice of $N_w$ and $N_q$

Default values of the arguments  $N_w$  and  $N_q$  may be selected by calling nag\_4d\_shep\_interp (e01tkc) with  $\mathbf{nw} \leq 0$  and  $\mathbf{nq} \leq 0$ . These default values,  $\mathbf{nw} = \min(32, m - 1)$  and  $\mathbf{nq} = \min(38, m - 1)$ , may well be satisfactory for many applications.

If non-default values are required they must be supplied to nag\_4d\_shep\_interp (e01tkc) through positive values of  $\mathbf{nw}$  and  $\mathbf{nq}$ . Increasing these argument values makes the method less local. This may increase the accuracy of the resulting interpolant at the expense of increased computational cost.

## 10 Example

This program reads in a set of 30 data points and calls nag\_4d\_shep\_interp (e01tkc) to construct an interpolating function  $Q(\mathbf{x})$ . It then calls nag\_4d\_shep\_eval (e01tlc) to evaluate the interpolant at a set of points.

Note that this example is not typical of a realistic problem: the number of data points would normally be larger.

See also Section 10 in nag\_4d\_shep\_eval (e01tlc).
