

# NAG Library Function Document

## nag\_dtbtrs (f07vec)

### 1 Purpose

nag\_dtbtrs (f07vec) solves a real triangular band system of linear equations with multiple right-hand sides,  $AX = B$  or  $A^T X = B$ .

### 2 Specification

```
#include <nag.h>
#include <nagf07.h>

void nag_dtbtrs (Nag_OrderType order, Nag_UploType uplo,
                Nag_TransType trans, Nag_DiagType diag, Integer n, Integer kd,
                Integer nrhs, const double ab[], Integer pdab, double b[], Integer pdb,
                NagError *fail)
```

### 3 Description

nag\_dtbtrs (f07vec) solves a real triangular band system of linear equations  $AX = B$  or  $A^T X = B$ .

### 4 References

Golub G H and Van Loan C F (1996) *Matrix Computations* (3rd Edition) Johns Hopkins University Press, Baltimore

Higham N J (1989) The accuracy of solutions to triangular systems *SIAM J. Numer. Anal.* **26** 1252–1265

### 5 Arguments

- 1: **order** – Nag\_OrderType *Input*  
*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.  
*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.
  
- 2: **uplo** – Nag\_UploType *Input*  
*On entry:* specifies whether  $A$  is upper or lower triangular.  
**uplo** = Nag\_Upper  
 $A$  is upper triangular.  
**uplo** = Nag\_Lower  
 $A$  is lower triangular.  
*Constraint:* **uplo** = Nag\_Upper or Nag\_Lower.
  
- 3: **trans** – Nag\_TransType *Input*  
*On entry:* indicates the form of the equations.  
**trans** = Nag\_NoTrans  
The equations are of the form  $AX = B$ .

**trans** = Nag\_Trans or Nag\_ConjTrans

The equations are of the form  $A^T X = B$ .

*Constraint:* **trans** = Nag\_NoTrans, Nag\_Trans or Nag\_ConjTrans.

4: **diag** – Nag\_DiagType *Input*

*On entry:* indicates whether  $A$  is a nonunit or unit triangular matrix.

**diag** = Nag\_NonUnitDiag

$A$  is a nonunit triangular matrix.

**diag** = Nag\_UnitDiag

$A$  is a unit triangular matrix; the diagonal elements are not referenced and are assumed to be 1.

*Constraint:* **diag** = Nag\_NonUnitDiag or Nag\_UnitDiag.

5: **n** – Integer *Input*

*On entry:*  $n$ , the order of the matrix  $A$ .

*Constraint:*  $n \geq 0$ .

6: **kd** – Integer *Input*

*On entry:*  $k_d$ , the number of superdiagonals of the matrix  $A$  if **uplo** = Nag\_Upper, or the number of subdiagonals if **uplo** = Nag\_Lower.

*Constraint:*  $kd \geq 0$ .

7: **nrhs** – Integer *Input*

*On entry:*  $r$ , the number of right-hand sides.

*Constraint:* **nrhs**  $\geq 0$ .

8: **ab**[*dim*] – const double *Input*

**Note:** the dimension, *dim*, of the array **ab** must be at least  $\max(1, \mathbf{pdab} \times \mathbf{n})$ .

*On entry:* the  $n$  by  $n$  triangular band matrix  $A$ .

This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements of  $A_{ij}$ , depends on the **order** and **uplo** arguments as follows:

if **order** = Nag\_ColMajor and **uplo** = Nag\_Upper,

$A_{ij}$  is stored in **ab**[ $k_d + i - j + (j - 1) \times \mathbf{pdab}$ ], for  $j = 1, \dots, n$  and  $i = \max(1, j - k_d), \dots, j$ ;

if **order** = Nag\_ColMajor and **uplo** = Nag\_Lower,

$A_{ij}$  is stored in **ab**[ $i - j + (j - 1) \times \mathbf{pdab}$ ], for  $j = 1, \dots, n$  and  $i = j, \dots, \min(n, j + k_d)$ ;

if **order** = Nag\_RowMajor and **uplo** = Nag\_Upper,

$A_{ij}$  is stored in **ab**[ $j - i + (i - 1) \times \mathbf{pdab}$ ], for  $i = 1, \dots, n$  and  $j = i, \dots, \min(n, i + k_d)$ ;

if **order** = Nag\_RowMajor and **uplo** = Nag\_Lower,

$A_{ij}$  is stored in **ab**[ $k_d + j - i + (i - 1) \times \mathbf{pdab}$ ], for  $i = 1, \dots, n$  and  $j = \max(1, i - k_d), \dots, i$ .

If **diag** = Nag\_UnitDiag, the diagonal elements of AB are assumed to be 1, and are not referenced.

- 9: **pdab** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix *A* in the array **ab**.  
*Constraint:* **pdab**  $\geq$  **kd** + 1.
- 10: **b**[*dim*] – double *Input/Output*  
**Note:** the dimension, *dim*, of the array **b** must be at least  
 $\max(1, \mathbf{pdb} \times \mathbf{nrhs})$  when **order** = Nag\_ColMajor;  
 $\max(1, \mathbf{n} \times \mathbf{pdb})$  when **order** = Nag\_RowMajor.  
The (*i*, *j*)th element of the matrix *B* is stored in  
 $\mathbf{b}[(j - 1) \times \mathbf{pdb} + i - 1]$  when **order** = Nag\_ColMajor;  
 $\mathbf{b}[(i - 1) \times \mathbf{pdb} + j - 1]$  when **order** = Nag\_RowMajor.  
*On entry:* the *n* by *r* right-hand side matrix *B*.  
*On exit:* the *n* by *r* solution matrix *X*.
- 11: **pdb** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **b**.  
*Constraints:*  
if **order** = Nag\_ColMajor, **pdb**  $\geq$   $\max(1, \mathbf{n})$ ;  
if **order** = Nag\_RowMajor, **pdb**  $\geq$   $\max(1, \mathbf{nrhs})$ .
- 12: **fail** – NagError \* *Input/Output*  
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument *<value>* had an illegal value.

### NE\_INT

On entry, **kd** = *<value>*.

Constraint: **kd**  $\geq$  0.

On entry, **n** = *<value>*.

Constraint: **n**  $\geq$  0.

On entry, **nrhs** = *<value>*.

Constraint: **nrhs**  $\geq$  0.

On entry, **pdab** = *<value>*.

Constraint: **pdab**  $>$  0.

On entry, **pdb** = *<value>*.

Constraint: **pdb**  $>$  0.

**NE\_INT\_2**

On entry, **pdab** =  $\langle value \rangle$  and **kd** =  $\langle value \rangle$ .

Constraint: **pdab**  $\geq$  **kd** + 1.

On entry, **pdb** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pdb**  $\geq$  max(1, **n**).

On entry, **pdb** =  $\langle value \rangle$  and **nrhs** =  $\langle value \rangle$ .

Constraint: **pdb**  $\geq$  max(1, **nrhs**).

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

**NE\_SINGULAR**

Element  $\langle value \rangle$  of the diagonal is exactly zero.  $A$  is singular and the solution has not been computed.

**7 Accuracy**

The solutions of triangular systems of equations are usually computed to high accuracy. See Higham (1989).

For each right-hand side vector  $b$ , the computed solution  $x$  is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(k)\epsilon|A|,$$

$c(k)$  is a modest linear function of  $k$ , and  $\epsilon$  is the *machine precision*.

If  $\hat{x}$  is the true solution, then the computed solution  $x$  satisfies a forward error bound of the form

$$\frac{\|x - \hat{x}\|_{\infty}}{\|x\|_{\infty}} \leq c(k) \text{cond}(A, x)\epsilon, \quad \text{provided} \quad c(k) \text{cond}(A, x)\epsilon < 1,$$

where  $\text{cond}(A, x) = \frac{\|A^{-1}\|_{\infty}\|A\|_{\infty}}{\|x\|_{\infty}}$ .

Note that  $\text{cond}(A, x) \leq \text{cond}(A) = \frac{\|A^{-1}\|_{\infty}\|A\|_{\infty}}{1} \leq \kappa_{\infty}(A)$ ;  $\text{cond}(A, x)$  can be much smaller than  $\text{cond}(A)$  and it is also possible for  $\text{cond}(A^T)$  to be much larger (or smaller) than  $\text{cond}(A)$ .

Forward and backward error bounds can be computed by calling `nag_dtbrfs` (f07vhc), and an estimate for  $\kappa_{\infty}(A)$  can be obtained by calling `nag_dtbcon` (f07vgc) with **norm** = Nag\_InfNorm.

**8 Parallelism and Performance**

`nag_dtbtrs` (f07vec) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_dtbtrs` (f07vec) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The total number of floating-point operations is approximately  $2nkr$  if  $k \ll n$ .

The complex analogue of this function is `nag_ztbtrs` (f07vsc).

## 10 Example

This example solves the system of equations  $AX = B$ , where

$$A = \begin{pmatrix} -4.16 & 0.00 & 0.00 & 0.00 \\ -2.25 & 4.78 & 0.00 & 0.00 \\ 0.00 & 5.86 & 6.32 & 0.00 \\ 0.00 & 0.00 & -4.82 & 0.16 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} -16.64 & -4.16 \\ -13.78 & -16.59 \\ 13.10 & -4.94 \\ -14.14 & -9.96 \end{pmatrix}.$$

Here  $A$  is treated as a lower triangular band matrix with one subdiagonal.
