

NAG Library Function Document

nag_zgges (f08xnc)

1 Purpose

nag_zgges (f08xnc) computes the generalized eigenvalues, the generalized Schur form (S, T) and, optionally, the left and/or right generalized Schur vectors for a pair of n by n complex nonsymmetric matrices (A, B) . nag_zgges (f08xnc) is marked as *deprecated* by LAPACK; the replacement routine is nag_zgges3 (f08xqc) which makes better use of level 3 BLAS.

2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_zgges (Nag_OrderType order, Nag_LeftVecsType jobvsl,
               Nag_RightVecsType jobvsr, Nag_SortEigValsType sort,
               Nag_Boolean (*selctg)(Complex a, Complex b),
               Integer n, Complex a[], Integer pda, Complex b[], Integer pdb,
               Integer *sdim, Complex alpha[], Complex beta[], Complex vsl[],
               Integer pdvsl, Complex vsr[], Integer pdvsr, NagError *fail)
```

3 Description

The generalized Schur factorization for a pair of complex matrices (A, B) is given by

$$A = QSZ^H, \quad B = QTZ^H,$$

where Q and Z are unitary, T and S are upper triangular. The generalized eigenvalues, λ , of (A, B) are computed from the diagonals of T and S and satisfy

$$Az = \lambda Bz,$$

where z is the corresponding generalized eigenvector. λ is actually returned as the pair (α, β) such that

$$\lambda = \alpha/\beta$$

since β , or even both α and β can be zero. The columns of Q and Z are the left and right generalized Schur vectors of (A, B) .

Optionally, nag_zgges (f08xnc) can order the generalized eigenvalues on the diagonals of (S, T) so that selected eigenvalues are at the top left. The leading columns of Q and Z then form an orthonormal basis for the corresponding eigenspaces, the deflating subspaces.

nag_zgges (f08xnc) computes T to have real non-negative diagonal entries. The generalized Schur factorization, before reordering, is computed by the QZ algorithm.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.
Constraint: **order** = Nag_RowMajor or Nag_ColMajor.
- 2: **jobvsl** – Nag_LeftVecsType *Input*
On entry: if **jobvsl** = Nag_NotLeftVecs, do not compute the left Schur vectors.
 If **jobvsl** = Nag_LeftVecs, compute the left Schur vectors.
Constraint: **jobvsl** = Nag_NotLeftVecs or Nag_LeftVecs.
- 3: **jobvsr** – Nag_RightVecsType *Input*
On entry: if **jobvsr** = Nag_NotRightVecs, do not compute the right Schur vectors.
 If **jobvsr** = Nag_RightVecs, compute the right Schur vectors.
Constraint: **jobvsr** = Nag_NotRightVecs or Nag_RightVecs.
- 4: **sort** – Nag_SortEigValsType *Input*
On entry: specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.
sort = Nag_NoSortEigVals
 Eigenvalues are not ordered.
sort = Nag_SortEigVals
 Eigenvalues are ordered (see **selctg**).
Constraint: **sort** = Nag_NoSortEigVals or Nag_SortEigVals.
- 5: **selctg** – function, supplied by the user *External Function*
 If **sort** = Nag_SortEigVals, **selctg** is used to select generalized eigenvalues to be moved to the top left of the generalized Schur form.
 If **sort** = Nag_NoSortEigVals, **selctg** is not referenced by nag_zgges (f08xnc), and may be specified as NULLFN.

The specification of **selctg** is:

Nag_Boolean selctg (Complex a, Complex b)

- 1: **a** – Complex *Input*
 2: **b** – Complex *Input*

On entry: an eigenvalue $\mathbf{a}[j-1]/\mathbf{b}[j-1]$ is selected if **selctg**($\mathbf{a}[j-1], \mathbf{b}[j-1]$) is Nag_TRUE.

Note that in the ill-conditioned case, a selected generalized eigenvalue may no longer satisfy **selctg**($\mathbf{a}[j-1], \mathbf{b}[j-1]$) = Nag_TRUE after ordering. **fail.code** = NE_SCHUR_REORDER_SELECT in this case.

- 6: **n** – Integer *Input*
On entry: n , the order of the matrices A and B .
Constraint: $\mathbf{n} \geq 0$.

- 7: **a**[*dim*] – Complex Input/Output
Note: the dimension, *dim*, of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.
The (*i*, *j*)th element of the matrix *A* is stored in
 $\mathbf{a}[(j-1) \times \mathbf{pda} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{a}[(i-1) \times \mathbf{pda} + j - 1]$ when **order** = Nag_RowMajor.
On entry: the first of the pair of matrices, *A*.
On exit: **a** has been overwritten by its generalized Schur form *S*.
- 8: **pda** – Integer Input
On entry: the stride separating row or column elements (depending on the value of **order**) in the array **a**.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.
- 9: **b**[*dim*] – Complex Input/Output
Note: the dimension, *dim*, of the array **b** must be at least $\max(1, \mathbf{pdb} \times \mathbf{n})$.
The (*i*, *j*)th element of the matrix *B* is stored in
 $\mathbf{b}[(j-1) \times \mathbf{pdb} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{b}[(i-1) \times \mathbf{pdb} + j - 1]$ when **order** = Nag_RowMajor.
On entry: the second of the pair of matrices, *B*.
On exit: **b** has been overwritten by its generalized Schur form *T*.
- 10: **pdb** – Integer Input
On entry: the stride separating row or column elements (depending on the value of **order**) in the array **b**.
Constraint: **pdb** $\geq \max(1, \mathbf{n})$.
- 11: **sdim** – Integer * Output
On exit: if **sort** = Nag_NoSortEigVals, **sdim** = 0.
If **sort** = Nag_SortEigVals, **sdim** = number of eigenvalues (after sorting) for which **selectg** is Nag_TRUE.
- 12: **alpha**[**n**] – Complex Output
On exit: see the description of **beta**.
- 13: **beta**[**n**] – Complex Output
On exit: **alpha**[*j* - 1]/**beta**[*j* - 1], for $j = 1, 2, \dots, \mathbf{n}$, will be the generalized eigenvalues. **alpha**[*j* - 1], for $j = 1, 2, \dots, \mathbf{n}$ and **beta**[*j* - 1], for $j = 1, 2, \dots, \mathbf{n}$, are the diagonals of the complex Schur form (*A*, *B*) output by nag_zgges (f08xnc). The **beta**[*j* - 1] will be non-negative real.
Note: the quotients **alpha**[*j* - 1]/**beta**[*j* - 1] may easily overflow or underflow, and **beta**[*j* - 1] may even be zero. Thus, you should avoid naively computing the ratio α/β . However, **alpha** will always be less than and usually comparable with $\|A\|_2$ in magnitude, and **beta** will always be less than and usually comparable with $\|B\|_2$.

14: **vsl**[*dim*] – Complex *Output*

Note: the dimension, *dim*, of the array **vsl** must be at least

$\max(1, \mathbf{pdvsl} \times \mathbf{n})$ when **jobvsl** = Nag_LeftVecs;
1 otherwise.

The (*i*, *j*)th element of the matrix is stored in

vsl[(*j* – 1) × **pdvsl** + *i* – 1] when **order** = Nag_ColMajor;
vsl[(*i* – 1) × **pdvsl** + *j* – 1] when **order** = Nag_RowMajor.

On exit: if **jobvsl** = Nag_LeftVecs, **vsl** will contain the left Schur vectors, *Q*.

If **jobvsl** = Nag_NotLeftVecs, **vsl** is not referenced.

15: **pdvsl** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **vsl**.

Constraints:

if **jobvsl** = Nag_LeftVecs, **pdvsl** ≥ $\max(1, \mathbf{n})$;
otherwise **pdvsl** ≥ 1.

16: **vsr**[*dim*] – Complex *Output*

Note: the dimension, *dim*, of the array **vsr** must be at least

$\max(1, \mathbf{pdvsr} \times \mathbf{n})$ when **jobvsr** = Nag_RightVecs;
1 otherwise.

The (*i*, *j*)th element of the matrix is stored in

vsr[(*j* – 1) × **pdvsr** + *i* – 1] when **order** = Nag_ColMajor;
vsr[(*i* – 1) × **pdvsr** + *j* – 1] when **order** = Nag_RowMajor.

On exit: if **jobvsr** = Nag_RightVecs, **vsr** will contain the right Schur vectors, *Z*.

If **jobvsr** = Nag_NotRightVecs, **vsr** is not referenced.

17: **pdvsr** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **vsr**.

Constraints:

if **jobvsr** = Nag_RightVecs, **pdvsr** ≥ $\max(1, \mathbf{n})$;
otherwise **pdvsr** ≥ 1.

18: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument *value* had an illegal value.

NE_ENUM_INT_2

On entry, **jobvsl** = *⟨value⟩*, **pdvsl** = *⟨value⟩* and **n** = *⟨value⟩*.
 Constraint: if **jobvsl** = Nag_LeftVecs, **pdvsl** \geq max(1, **n**);
 otherwise **pdvsl** \geq 1.

On entry, **jobvsr** = *⟨value⟩*, **pdvsr** = *⟨value⟩* and **n** = *⟨value⟩*.
 Constraint: if **jobvsr** = Nag_RightVecs, **pdvsr** \geq max(1, **n**);
 otherwise **pdvsr** \geq 1.

NE_INT

On entry, **n** = *⟨value⟩*.
 Constraint: **n** \geq 0.

On entry, **pda** = *⟨value⟩*.
 Constraint: **pda** $>$ 0.

On entry, **pdb** = *⟨value⟩*.
 Constraint: **pdb** $>$ 0.

On entry, **pdvsl** = *⟨value⟩*.
 Constraint: **pdvsl** $>$ 0.

On entry, **pdvsr** = *⟨value⟩*.
 Constraint: **pdvsr** $>$ 0.

NE_INT_2

On entry, **pda** = *⟨value⟩* and **n** = *⟨value⟩*.
 Constraint: **pda** \geq max(1, **n**).

On entry, **pdb** = *⟨value⟩* and **n** = *⟨value⟩*.
 Constraint: **pdb** \geq max(1, **n**).

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
 See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

NE_ITERATION_QZ

The *QZ* iteration did not converge and the matrix pair (*A*, *B*) is not in the generalized Schur form. The computed α_i and β_i should be correct for $i = \langle value \rangle, \dots, \langle value \rangle$.

The *QZ* iteration failed with an unexpected error, please contact NAG.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
 See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

NE_SCHUR_REORDER

The eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned).

NE_SCHUR_REORDER_SELECT

After reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy **selectg** = Nag_TRUE. This could also be caused by underflow due to scaling.

7 Accuracy

The computed generalized Schur factorization satisfies

$$A + E = QSZ^H, \quad B + F = QTZ^H,$$

where

$$\|(E, F)\|_F = O(\epsilon)\|(A, B)\|_F$$

and ϵ is the *machine precision*. See Section 4.11 of Anderson *et al.* (1999) for further details.

8 Parallelism and Performance

nag_zgges (f08xnc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zgges (f08xnc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is proportional to n^3 .

The real analogue of this function is nag_dgges (f08xac).

10 Example

This example finds the generalized Schur factorization of the matrix pair (A, B) , where

$$A = \begin{pmatrix} -21.10 - 22.50i & 53.50 - 50.50i & -34.50 + 127.50i & 7.50 + 0.50i \\ -0.46 - 7.78i & -3.50 - 37.50i & -15.50 + 58.50i & -10.50 - 1.50i \\ 4.30 - 5.50i & 39.70 - 17.10i & -68.50 + 12.50i & -7.50 - 3.50i \\ 5.50 + 4.40i & 14.40 + 43.30i & -32.50 - 46.00i & -19.00 - 32.50i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 1.00 - 5.00i & 1.60 + 1.20i & -3.00 + 0.00i & 0.00 - 1.00i \\ 0.80 - 0.60i & 3.00 - 5.00i & -4.00 + 3.00i & -2.40 - 3.20i \\ 1.00 + 0.00i & 2.40 + 1.80i & -4.00 - 5.00i & 0.00 - 3.00i \\ 0.00 + 1.00i & -1.80 + 2.40i & 0.00 - 4.00i & 4.00 - 5.00i \end{pmatrix}.$$
