NAG Library Function Document

nag_ztr_copy (f16tec)

1 Purpose

nag_ztr_copy (f16tec) copies a complex triangular matrix.

2 Specification

```
#include <nag.h>
#include <nagf16.h>
void nag_ztr_copy (Nag_OrderType order, Nag_UploType uplo,
     Nag_TransType trans, Nag_DiagType diag, Integer n, const Complex a[],
     Integer pda, Complex b[], Integer pdb, NagError *fail)
```

3 Description

nag_ztr_copy (f16tec) performs the triangular matrix copy operations

$$B \leftarrow A, \quad B \leftarrow A^{\mathrm{T}} \quad \text{or} \quad B \leftarrow A^{\mathrm{H}}$$

where A and B are n by n complex triangular matrices.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UploType *Input*

On entry: specifies whether the upper or lower triangular part of A is stored.

uplo = Nag_Upper
The upper triangular part of A is stored.

uplo = Nag_Lower
The lower triangular part of A is stored.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

3: **trans** – Nag_TransType *Input*

On entry: specifies the operation to be performed.

trans = Nag_NoTrans
$B \leftarrow A$.

trans = Nag_Trans
$B \leftarrow A^{\mathrm{T}}$.

trans = Nag_ConjTrans
$B \leftarrow A^{\mathrm{H}}$.

Constraint: **trans** = Nag_NoTrans, Nag_Trans or Nag_ConjTrans.

4: **diag** – Nag_DiagType *Input*

On entry: specifies whether A has nonunit or unit diagonal elements.

diag = Nag_NonUnitDiag
The diagonal elements are stored explicitly.

diag = Nag_UnitDiag
The diagonal elements are assumed to be 1 and are not referenced.

Constraint: **diag** = Nag_NonUnitDiag or Nag_UnitDiag.

5: **n** – Integer *Input*

On entry: n, the order of the matrices A and B.

Constraint: **n** ≥ 0.

6: **a**$[dim]$ – const Complex *Input*

Note: the dimension, *dim*, of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.

On entry: the n by n triangular matrix A.

If **order** = Nag_ColMajor, A_{ij} is stored in **a**$[(j-1) \times \mathbf{pda} + i - 1]$.

If **order** = Nag_RowMajor, A_{ij} is stored in **a**$[(i-1) \times \mathbf{pda} + j - 1]$.

If **uplo** = Nag_Upper, the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.

If **uplo** = Nag_Lower, the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.

If **diag** = Nag_UnitDiag, the diagonal elements of A are assumed to be 1, and are not referenced.

7: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **a**.

Constraint: **pda** $\geq \max(1, \mathbf{n})$.

8: **b**$[dim]$ – Complex *Output*

Note: the dimension, *dim*, of the array **b** must be at least $\max(1, \mathbf{pdb} \times \mathbf{n})$.

On exit: the n by n triangular matrix B.

If **order** = Nag_ColMajor, B_{ij} is stored in **b**$[(j-1) \times \mathbf{pdb} + i - 1]$.

If **order** = Nag_RowMajor, B_{ij} is stored in **b**$[(i-1) \times \mathbf{pdb} + j - 1]$.

If **uplo** = Nag_Upper and **trans** = Nag_NoTrans or if **uplo** = Nag_Lower and **trans** = Nag_Trans or **trans** = Nag_ConjTrans, B is upper triangular and the elements of the array below the diagonal are not set.

If **uplo** = Nag_Lower and **trans** = Nag_NoTrans or if **uplo** = Nag_Upper and **trans** = Nag_Trans or **trans** = Nag_ConjTrans, B is lower triangular and the elements of the array above the diagonal are not set.

9: **pdb** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **b**.

Constraint: **pdb** $\geq \max(1, \mathbf{n})$.

10: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

NE_INT_2

On entry, **pda** = ⟨*value*⟩, **n** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.

On entry, **pdb** = ⟨*value*⟩, **n** = ⟨*value*⟩.
Constraint: **pdb** $\geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Parallelism and Performance

nag_ztr_copy (f16tec) is not threaded in any implementation.

9 Further Comments

None.

10 Example

Initializes a 4 by 4 lower triangular matrix A and copies its conjugate transpose to the upper triangular part of B.
