

## NAG Library Function Document

### nag\_multi\_students\_t (g01hdc)

#### 1 Purpose

nag\_multi\_students\_t (g01hdc) returns a probability associated with a multivariate Student's  $t$ -distribution.

#### 2 Specification

```
#include <nag.h>
#include <nagg01.h>

double nag_multi_students_t (Integer n, const Nag_TailProbability tail[],
    const double a[], const double b[], double nu, const double delta[],
    Nag_Boolean iscov, double rc[], Integer pdrc, double epsabs,
    double epsrel, Integer numsub, Integer nsampl, Integer fmax,
    double *errest, NagError *fail)
```

#### 3 Description

A random vector  $x \in \mathbb{R}^n$  that follows a Student's  $t$ -distribution with  $\nu$  degrees of freedom and covariance matrix  $\Sigma$  has density:

$$\frac{\Gamma((\nu + n)/2)}{\Gamma(\nu/2)\nu^{n/2}\pi^{n/2}|\Sigma|^{1/2}\left[1 + \frac{1}{\nu}x^T\Sigma^{-1}x\right]^{(\nu+n)/2}}$$

and probability  $p$  given by:

$$p = \frac{\Gamma((\nu + n)/2)}{\Gamma(\nu/2)\sqrt{|\Sigma|}(\pi\nu)^n} \int_{a_1}^{b_1} \int_{a_2}^{b_2} \cdots \int_{a_n}^{b_n} \left(1 + x^T\Sigma^{-1}x/\nu\right)^{-(\nu+n)/2} dx.$$

The method of calculation depends on the dimension  $n$  and degrees of freedom  $\nu$ . The method of Dunnet and Sobel is used in the bivariate case if  $\nu$  is a whole number. A Plackett transform followed by quadrature method is adopted in other bivariate cases and trivariate cases. In dimensions higher than three a number theoretic approach to evaluating multidimensional integrals is adopted.

Error estimates are supplied as the published accuracy in the Dunnet and Sobel case, a Monte–Carlo standard error for multidimensional integrals, and otherwise the quadrature error estimate.

A parameter  $\delta$  allows for non-central probabilities. The number theoretic method is used if any  $\delta$  is nonzero.

In cases other than the central bivariate with whole  $\nu$ , nag\_multi\_students\_t (g01hdc) attempts to evaluate probabilities within a requested accuracy  $\max(\epsilon_a, \epsilon_r \times I)$ , for an approximate integral value  $I$ , absolute accuracy  $\epsilon_a$  and relative accuracy  $\epsilon_r$ .

## 5 Arguments

- 1: **n** – Integer *Input*  
*On entry:*  $n$ , the number of dimensions.  
*Constraint:*  $1 < \mathbf{n} \leq 1000$ .
- 2: **tail[n]** – const Nag\_TailProbability *Input*  
*On entry:* defines the calculated probability, set **tail**[ $i - 1$ ] to:  
**tail**[ $i - 1$ ] = Nag\_LowerTail  
 If the  $i$ th lower limit  $a_i$  is negative infinity.  
**tail**[ $i - 1$ ] = Nag\_UpperTail  
 If the  $i$ th upper limit  $b_i$  is infinity.  
**tail**[ $i - 1$ ] = Nag\_Central  
 If both  $a_i$  and  $b_i$  are finite.  
*Constraint:* **tail**[ $i - 1$ ] = Nag\_LowerTail, Nag\_UpperTail or Nag\_Central, for  $i = 1, 2, \dots, \mathbf{n}$ .
- 3: **a[n]** – const double *Input*  
*On entry:*  $a_i$ , for  $i = 1, 2, \dots, n$ , the lower integral limits of the calculation.  
 If **tail**[ $i - 1$ ] = Nag\_LowerTail, **a**[ $i - 1$ ] is not referenced and the  $i$ th lower limit of integration is  $-\infty$ .
- 4: **b[n]** – const double *Input*  
*On entry:*  $b_i$ , for  $i = 1, 2, \dots, n$ , the upper integral limits of the calculation.  
 If **tail**[ $i - 1$ ] = Nag\_UpperTail, **b**[ $i - 1$ ] is not referenced and the  $i$ th upper limit of integration is  $\infty$ .  
*Constraint:* if **tail**[ $i - 1$ ] = Nag\_Central, **b**[ $i - 1$ ] > **a**[ $i - 1$ ].
- 5: **nu** – double *Input*  
*On entry:*  $\nu$ , the degrees of freedom.  
*Constraint:* **nu** > 0.0.
- 6: **delta[n]** – const double *Input*  
*On entry:* **delta**[ $i - 1$ ] the noncentrality parameter for the  $i$ th dimension, for  $i = 1, 2, \dots, \mathbf{n}$ ; set **delta**[ $i - 1$ ] = 0 for the central probability.
- 7: **iscov** – Nag\_Boolean *Input*  
*On entry:* set **iscov** = Nag\_TRUE if the covariance matrix is supplied and **iscov** = Nag\_FALSE if the correlation matrix is supplied.
- 8: **rc[n × pdrc]** – double *Input/Output*  
**Note:** the  $(i, j)$ th element of the matrix is stored in **rc**[( $i - 1$ ) × **pdrc** +  $j - 1$ ].  
*On entry:* the lower triangle of either the covariance matrix (if **iscov** = Nag\_TRUE) or the correlation matrix (if **iscov** = Nag\_FALSE). In either case the array elements corresponding to the upper triangle of the matrix need not be set.  
*On exit:* the strict upper triangle of **rc** contains the correlation matrix used in the calculations.

- 9: **pdrc** – Integer *Input*  
*On entry:* the stride separating matrix column elements in the array **rc**.  
*Constraint:* **pdrc**  $\geq$  **n**.
- 10: **epsabs** – double *Input*  
*On entry:*  $\epsilon_a$ , the absolute accuracy requested in the approximation. If **epsabs** is negative, the absolute value is used.  
*Suggested value:* 0.0.
- 11: **epsrel** – double *Input*  
*On entry:*  $\epsilon_r$ , the relative accuracy requested in the approximation. If **epsrel** is negative, the absolute value is used.  
*Suggested value:* 0.001.
- 12: **numsub** – Integer *Input*  
*On entry:* if quadrature is used, the number of sub-intervals used by the quadrature algorithm; otherwise **numsub** is not referenced.  
*Suggested value:* 350.  
*Constraint:* if referenced, **numsub**  $>$  0.
- 13: **nsampl** – Integer *Input*  
*On entry:* if quadrature is used, **nsampl** is not referenced; otherwise **nsampl** is the number of samples used to estimate the error in the approximation.  
*Suggested value:* 8.  
*Constraint:* if referenced, **nsampl**  $>$  0.
- 14: **fmax** – Integer *Input*  
*On entry:* if a number theoretic approach is used, the maximum number of evaluations for each integrand function.  
*Suggested value:*  $1000 \times \mathbf{n}$ .  
*Constraint:* if referenced, **fmax**  $\geq$  1.
- 15: **errest** – double \* *Output*  
*On exit:* an estimate of the error in the calculated probability.
- 16: **fail** – NagError \* *Input/Output*  
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

**NE\_ARRAY\_SIZE**

On entry, **pdrc** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .  
 Constraint: **pdrc**  $\geq$  **n**.

**NE\_BAD\_PARAM**

On entry, argument  $\langle value \rangle$  had an illegal value.

**NE\_INT**

On entry, **fmax** =  $\langle value \rangle$ .  
 Constraint: **fmax**  $\geq$  1.

On entry, **n** =  $\langle value \rangle$ .  
 Constraint:  $1 < \mathbf{n} \leq 1000$ .

On entry, **nsampl** =  $\langle value \rangle$ .  
 Constraint: **nsampl**  $\geq$  1.

On entry, **numsub** =  $\langle value \rangle$ .  
 Constraint: **numsub**  $\geq$  1.

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.  
 See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

**NE\_INVALID\_ARRAY**

On entry, the information supplied in **rc** is invalid.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.  
 See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

**NE\_REAL**

On entry, **nu** =  $\langle value \rangle$ .  
 Constraint: degrees of freedom **nu**  $>$  0.0.

**NE\_REAL\_2**

On entry,  $k = \langle value \rangle$ .  
 Constraint:  $\mathbf{b}[k - 1] > \mathbf{a}[k - 1]$  for a central probability.

**7 Accuracy**

An estimate of the error in the calculation is given by the value of **errest** on exit.

**8 Parallelism and Performance**

nag\_multi\_students\_t (g01hdc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

None.

## 10 Example

This example prints two probabilities from the Student's  $t$ -distribution.
