

NAG Library Function Document

nag_sum_sqs_update (g02btc)

1 Purpose

nag_sum_sqs_update (g02btc) updates the sample means and sums of squares and cross-products, or sums of squares and cross-products of deviations about the mean, for a new observation. The data may be weighted.

2 Specification

```
#include <nag.h>
#include <nagg02.h>

void nag_sum_sqs_update (Nag_SumSquare mean, Integer m, double wt,
    const double x[], Integer incx, double *sw, double xbar[], double c[],
    NagError *fail)
```

3 Description

nag_sum_sqs_update (g02btc) is an adaptation of West's WV2 algorithm; see West (1979). This function updates the weighted means of variables and weighted sums of squares and cross-products or weighted sums of squares and cross-products of deviations about the mean for observations on m variables X_j , for $j = 1, 2, \dots, m$. For the first $i - 1$ observations let the mean of the j th variable be $\bar{x}_j(i - 1)$, the cross-product about the mean for the j th and k th variables be $c_{jk}(i - 1)$ and the sum of weights be W_{i-1} . These are updated by the i th observation, x_{ij} , for $j = 1, 2, \dots, m$, with weight w_i as follows:

$$W_i = W_{i-1} + w_i, \quad \bar{x}_j(i) = \bar{x}_j(i - 1) + \frac{w_i}{W_i}(x_j - \bar{x}_j(i - 1)), \quad j = 1, 2, \dots, m$$

and

$$c_{jk}(i) = c_{jk}(i - 1) + \frac{w_i}{W_i}(x_j - \bar{x}_j(i - 1))(x_k - \bar{x}_k(i - 1))W_{i-1}, \quad j = 1, 2, \dots, m; k = j, j + 1, 2, \dots, m.$$

The algorithm is initialized by taking $\bar{x}_j(1) = x_{1j}$, the first observation and $c_{ij}(1) = 0.0$.

For the unweighted case $w_i = 1$ and $W_i = i$ for all i .

5 Arguments

1: **mean** – Nag_SumSquare *Input*

On entry: indicates whether nag_sum_sqs_update (g02btc) is to calculate sums of squares and cross-products, or sums of squares and cross-products of deviations about the mean.

mean = Nag_AboutMean

The sums of squares and cross-products of deviations about the mean are calculated.

mean = Nag_AboutZero

The sums of squares and cross-products are calculated.

Constraint: **mean** = Nag_AboutMean or Nag_AboutZero.

- 2: **m** – Integer *Input*
On entry: m , the number of variables.
Constraint: $m \geq 1$.
- 3: **wt** – double *Input*
On entry: the weight to use for the current observation, w_i .
 For unweighted means and cross-products set **wt** = 1.0. The use of a suitable negative value of **wt**, e.g., $-w_i$ will have the effect of deleting the observation.
- 4: **x[m × incx]** – const double *Input*
On entry: **x**[($j - 1$) × **incx**] must contain the value of the j th variable for the current observation, $j = 1, 2, \dots, m$.
- 5: **incx** – Integer *Input*
On entry: the increment of **x**.
Constraint: **incx** > 0.
- 6: **sw** – double * *Input/Output*
On entry: the sum of weights for the previous observations, W_{i-1} .
sw = 0.0
 The update procedure is initialized.
sw + **wt** = 0.0
 All elements of **xbar** and **c** are set to zero.
Constraint: **sw** ≥ 0.0 and **sw** + **wt** ≥ 0.0.
On exit: contains the updated sum of weights, W_i .
- 7: **xbar[m]** – double *Input/Output*
On entry: if **sw** = 0.0, **xbar** is initialized, otherwise **xbar**[$j - 1$] must contain the weighted mean of the j th variable for the previous ($i - 1$) observations, $\bar{x}_j(i - 1)$, for $j = 1, 2, \dots, m$.
On exit: **xbar**[$j - 1$] contains the weighted mean of the j th variable, $\bar{x}_j(i)$, for $j = 1, 2, \dots, m$.
- 8: **c[(m × m + m)/2]** – double *Input/Output*
On entry: if **sw** ≠ 0.0, **c** must contain the upper triangular part of the matrix of weighted sums of squares and cross-products or weighted sums of squares and cross-products of deviations about the mean. It is stored packed form by column, i.e., the cross-product between the j th and k th variable, $k \geq j$, is stored in **c**[$k \times (k - 1)/2 + j - 1$].
On exit: the update sums of squares and cross-products stored as on input.
- 9: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, $\mathbf{incx} = \langle value \rangle$.

Constraint: $\mathbf{incx} \geq 1$.

On entry, $\mathbf{m} = \langle value \rangle$.

Constraint: $\mathbf{m} \geq 1$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

NE_REAL

On entry, $\mathbf{sw} = \langle value \rangle$.

Constraint: $\mathbf{sw} \geq 0.0$.

NE_SUM_WEIGHT

On entry, $(\mathbf{sw} + \mathbf{wt}) = \langle value \rangle$.

Constraint: $(\mathbf{sw} + \mathbf{wt}) \geq 0.0$.

7 Accuracy

For a detailed discussion of the accuracy of this method see Chan *et al.* (1982) and West (1979).

8 Parallelism and Performance

nag_sum_sqs_update (g02btc) is not threaded in any implementation.

9 Further Comments

nag_sum_sqs_update (g02btc) may be used to update the results returned by nag_sum_sqs (g02buc).

nag_cov_to_corr (g02bwc) may be used to calculate the correlation matrix from the matrix of sums of squares and cross-products of deviations about the mean .

10 Example

A program to calculate the means, the required sums of squares and cross-products matrix, and the variance matrix for a set of 3 observations of 3 variables.
