nag_smooth_spline_estim (g10acc)

1 Purpose

nag_smooth_spline_estim (g10acc) estimates the values of the smoothing argument and fits a cubic smoothing spline to a set of data.

2 Specification

```
#include <nag.h>
#include <nagg10.h>

void nag_smooth_spline_estim (Nag_SmoothParamMethods method, Integer n,
    const double x[], const double y[], const double weights[],
    double yhat[], double coeff[], double *rss, double *df, double res[],
    double h[], double *crit, double *rho, double u, double tol,
    Integer maxcal, NagError *fail)
```

3 Description

For a set of n observations (x_i, y_i) , for $i = 1, 2, \dots, n$, the spline provides a flexible smooth function for situations in which a simple polynomial or nonlinear regression model is not suitable.

Cubic smoothing splines arise as the unique real-valued solution function, f , with absolutely continuous first derivative and squared-integrable second derivative, which minimizes:

$$\sum_{i=1}^n w_i \{y_i - f(x_i)\}^2 + \rho \int_{-\infty}^{\infty} \{f''(x)\}^2 dx,$$

where w_i is the (optional) weight for the i th observation and ρ is the smoothing argument. This criterion consists of two parts: the first measures the fit of the curve and the second the smoothness of the curve. The value of the smoothing argument ρ weights these two aspects; larger values of ρ give a smoother fitted curve but, in general, a poorer fit. For details of how the cubic spline can be fitted see Hutchinson and de Hoog (1985) and Reinsch (1967).

The fitted values, $\hat{y} = (\hat{y}_1, \hat{y}_2, \dots, \hat{y}_n)^T$, and weighted residuals, r_i , can be written as:

$$\hat{y} = Hy \quad \text{and} \quad r_i = \sqrt{w_i}(y_i - \hat{y}_i)$$

for a matrix H . The residual degrees of freedom for the spline is $\text{trace}(I - H)$ and the diagonal elements of H are the leverages.

The argument ρ can be estimated in a number of ways.

1. The degrees of freedom for the spline can be specified, i.e., find ρ such that $\text{trace}(H) = \nu_0$ for given ν_0 .
2. Minimize the cross-validation (CV), i.e., find ρ such that the CV is minimized, where

$$\text{CV} = \frac{1}{\sum_{i=1}^n w_i} \sum_{i=1}^n \left[\frac{r_i}{1 - h_{ii}} \right]^2.$$

3. Minimize the generalized cross-validation (GCV), i.e., find ρ such that the GCV is minimized, where

$$\text{GCV} = \frac{n^2}{\sum_{i=1}^n w_i} \left[\frac{\sum_{i=1}^n r_i^2}{\left(\sum_{i=1}^n (1 - h_{ii}) \right)^2} \right].$$

nag_smooth_spline_estim (g10acc) requires the x_i to be strictly increasing. If two or more observations have the same x_i value then they should be replaced by a single observation with y_i equal to the (weighted) mean of the y values and weight, w_i , equal to the sum of the weights. This operation can be performed by nag_order_data (g10zac).

The algorithm is based on Hutchinson (1986).

5 Arguments

- 1: **method** – Nag_SmoothParamMethods *Input*
On entry: indicates whether the smoothing argument is to be found by minimization of the CV or GCV functions, or by finding the smoothing argument corresponding to a specified degrees of freedom value.
method = Nag_SmoothParamCV
Cross-validation is used.
method = Nag_SmoothParamDF
The degrees of freedom are specified.
method = Nag_SmoothParamGCV
Generalized cross-validation is used.
Constraint: **method** = Nag_SmoothParamCV, Nag_SmoothParamDF or Nag_SmoothParamGCV.
- 2: **n** – Integer *Input*
On entry: the number of observations, n .
Constraint: $n \geq 3$.
- 3: **x[n]** – const double *Input*
On entry: the distinct and ordered values x_i , for $i = 1, 2, \dots, n$.
Constraint: $\mathbf{x}[i - 1] < \mathbf{x}[i]$, for $i = 1, 2, \dots, n - 1$.
- 4: **y[n]** – const double *Input*
On entry: the values y_i , for $i = 1, 2, \dots, n$.

- 5: **weights**[**n**] – const double *Input*
On entry: **weights** must contain the n weights, if they are required. Otherwise, **weights** must be set to **NULL**.
Constraint: if **weights** are required, then **weights**[$i - 1$] > 0.0 , for $i = 1, 2, \dots, n$.
- 6: **yhat**[**n**] – double *Output*
On exit: the fitted values, \hat{y}_i , for $i = 1, 2, \dots, n$.
- 7: **coeff**[(**n** - 1) × 3] – double *Output*
On exit: the spline coefficients. More precisely, the value of the spline approximation at t is given by $((\mathbf{coeff}[(i - 1) \times (n - 1) + 2] \times d + \mathbf{coeff}[(i - 1) \times (n - 1) + 1]) \times d + \mathbf{coeff}[(i - 1) \times (n - 1)]) \times d + \hat{y}_i$, where $x_i \leq t < x_{i+1}$ and $d = t - x_i$.
- 8: **rss** – double * *Output*
On exit: the (weighted) residual sum of squares.
- 9: **df** – double * *Output*
On exit: the residual degrees of freedom. If **method** = Nag_SmoothParamDF, this will be $n - \mathbf{crit}$ to the required accuracy.
- 10: **res**[**n**] – double *Output*
On exit: the (weighted) residuals, r_i , for $i = 1, 2, \dots, n$.
- 11: **h**[**n**] – double *Output*
On exit: the leverages, h_{ii} , for $i = 1, 2, \dots, n$.
- 12: **crit** – double * *Input/Output*
On entry: if **method** = Nag_SmoothParamDF, the required degrees of freedom for the spline.
 If **method** = Nag_SmoothParamCV or Nag_SmoothParamGCV, **crit** need not be set.
Constraint: $2.0 < \mathbf{crit} \leq \mathbf{n}$.
On exit: if **method** = Nag_SmoothParamCV, the value of the cross-validation, or if **method** = Nag_SmoothParamGCV, the value of the generalized cross-validation function, evaluated at the value of ρ returned in **rho**.
- 13: **rho** – double * *Output*
On exit: the smoothing argument, ρ .
- 14: **u** – double *Input*
On entry: the upper bound on the smoothing argument. See Section 9 for details on how this argument is used.
Suggested value: **u** = 1000.0.
Constraint: **u** $>$ **tol**.
- 15: **tol** – double *Input*
On entry: the accuracy to which the smoothing argument **rho** is required. **tol** should be preferably not much less than $\sqrt{\epsilon}$, where ϵ is the *machine precision*.
Constraint: **tol** \geq *machine precision*.

- 16: **maxcal** – Integer *Input*
On entry: the maximum number of spline evaluations to be used in finding the value of ρ .
Suggested value: **maxcal** = 30.
Constraint: **maxcal** \geq 3.
- 17: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_2_REAL_ARG_LE

On entry, **u** = $\langle value \rangle$ while **tol** = $\langle value \rangle$. These arguments must satisfy **u** > **tol**.

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument **method** had an illegal value.

NE_G10AC_ACC

A solution to the accuracy given by **tol** has not been achieved in **maxcal** iterations. Try increasing the value of **tol** and/or **maxcal**.

NE_G10AC_CG_RHO

method = Nag_SmoothParamCV or Nag_SmoothParamGCV and the optimal value of **rho** > **u**. Try a larger value of **u**.

NE_G10AC_DF_RHO

method = Nag_SmoothParamDF and the required value of **rho** for specified degrees of freedom > **u**. Try a larger value of **u**.

NE_G10AC_DF_TOL

method = Nag_SmoothParamDF and the accuracy given by **tol** cannot be achieved. Try increasing the value of **tol**.

NE_INT_ARG_LT

On entry, **maxcal** = $\langle value \rangle$.
 Constraint: **maxcal** \geq 3.

On entry, **n** = $\langle value \rangle$.
 Constraint: **n** \geq 3.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_NOT_STRICTLY_INCREASING

The sequence **x** is not strictly increasing: $\mathbf{x}[\langle value \rangle] = \langle value \rangle$, $\mathbf{x}[\langle value \rangle] = \langle value \rangle$.

NE_REAL

On entry, **crit** = $\langle value \rangle$.

Constraint: **crit** > 2.0, if **method** = Nag_SmoothParamDF.

NE_REAL_ARRAY_CONS

On entry, **weights**[$\langle value \rangle$] = $\langle value \rangle$.

Constraint: **weights**[i] > 0, for $i = 0, 1, \dots, n - 1$.

NE_REAL_INT_ARG_CONS

On entry, **crit** = $\langle value \rangle$ and **n** = $\langle value \rangle$. These arguments must satisfy **crit** ≤ **n**, if **method** = Nag_SmoothParamDF.

NE_REAL_MACH_PREC

On entry, **tol** = $\langle value \rangle$, **machine precision**(nag_machine_precision) = $\langle value \rangle$.

Constraint: **tol** ≥ **machine precision**.

7 Accuracy

When minimizing the cross-validation or generalized cross-validation, the error in the estimate of ρ should be within $\pm 3 \times (\mathbf{tol} \times \mathbf{rho} + \mathbf{tol})$. When finding ρ for a fixed number of degrees of freedom the error in the estimate of ρ should be within $\pm 2 \times \mathbf{tol} \times \max(1, \mathbf{rho})$.

Given the value of ρ , the accuracy of the fitted spline depends on the value of ρ and the position of the x values. The values of $x_i - x_{i-1}$ and w_i are scaled and ρ is transformed to avoid underflow and overflow problems.

8 Parallelism and Performance

nag_smooth_spline_estim (g10acc) is not threaded in any implementation.

9 Further Comments

The time to fit the spline for a given value of ρ is of order n .

When finding the value of ρ that gives the required degrees of freedom, the algorithm examines the interval 0.0 to **u**. For small degrees of freedom the value of ρ can be large, as in the theoretical case of two degrees of freedom when the spline reduces to a straight line and ρ is infinite. If the CV or GCV is to be minimized then the algorithm searches for the minimum value in the interval 0.0 to **u**. If the function is decreasing in that range then the boundary value of **u** will be returned. In either case, the larger the value of **u** the more likely is the interval to contain the required solution, but the process will be less efficient.

Regression splines with a small ($< n$) number of knots can be fitted by nag_1d_spline_fit_knots (e02bac) and nag_1d_spline_fit (e02bec).

10 Example

The data, given by Hastie and Tibshirani (1990), is the age, x_i , and C-peptide concentration (pmol/ml), y_i , from a study of the factors affecting insulin-dependent diabetes mellitus in children. The data is input, reduced to a strictly ordered set by nag_order_data (g10zac) and a spline with 5 degrees of freedom is fitted by nag_smooth_spline_estim (g10acc). The fitted values and residuals are printed.
