

NAG Library Routine Document

C06FFF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

C06FFF computes the discrete Fourier transform of one variable in a multivariate sequence of complex data values.

2 Specification

```
SUBROUTINE C06FFF (NDIM, L, ND, N, X, Y, WORK, LWORK, IFAIL)
  INTEGER          NDIM, L, ND(NDIM), N, LWORK, IFAIL
  REAL (KIND=nag_wp) X(N), Y(N), WORK(LWORK)
```

3 Description

C06FFF computes the discrete Fourier transform of one variable (the l th say) in a multivariate sequence of complex data values $z_{j_1 j_2 \dots j_m}$, for $j_1 = 0, 1, \dots, n_1 - 1$ and $j_2 = 0, 1, \dots, n_2 - 1$, and so on. Thus the individual dimensions are n_1, n_2, \dots, n_m , and the total number of data values is $n = n_1 \times n_2 \times \dots \times n_m$.

The routine computes n/n_l one-dimensional transforms defined by

$$\hat{z}_{j_1 \dots k_l \dots j_m} = \frac{1}{\sqrt{n_l}} \sum_{j_l=0}^{n_l-1} z_{j_1 \dots j_l \dots j_m} \times \exp\left(-\frac{2\pi i j_l k_l}{n_l}\right),$$

where $k_l = 0, 1, \dots, n_l - 1$.

(Note the scale factor of $\frac{1}{\sqrt{n_l}}$ in this definition.)

To compute the inverse discrete Fourier transforms, defined with $\exp\left(+\frac{2\pi i j_l k_l}{n_l}\right)$ in the above formula instead of $\exp\left(-\frac{2\pi i j_l k_l}{n_l}\right)$, this routine should be preceded and followed by the complex conjugation of the data values and the transform (by negating the imaginary parts stored in y).

The data values must be supplied in a pair of one-dimensional arrays (real and imaginary parts separately), in accordance with the Fortran convention for storing multidimensional data (i.e., with the first subscript j_1 varying most rapidly).

This routine calls C06FCF to perform one-dimensional discrete Fourier transforms by the fast Fourier transform (FFT) algorithm in Brigham (1974), and hence there are some restrictions on the values of n_l (see Section 5).

5 Arguments

1: NDIM – INTEGER

Input

On entry: m , the number of dimensions (or variables) in the multivariate data.

Constraint: NDIM \geq 1.

- 2: L – INTEGER *Input*
On entry: l , the index of the variable (or dimension) on which the discrete Fourier transform is to be performed.
Constraint: $1 \leq L \leq \text{NDIM}$.
- 3: ND(NDIM) – INTEGER array *Input*
On entry: ND(i) must contain n_i (the dimension of the i th variable), for $i = 1, 2, \dots, m$. The largest prime factor of ND(l) must not exceed 19, and the total number of prime factors of ND(l), counting repetitions, must not exceed 20.
Constraint: ND(i) ≥ 1 , for $i = 1, 2, \dots, \text{NDIM}$.
- 4: N – INTEGER *Input*
On entry: n , the total number of data values.
Constraint: $N = \text{ND}(1) \times \text{ND}(2) \times \dots \times \text{ND}(\text{NDIM})$.
- 5: X(N) – REAL (KIND=nag_wp) array *Input/Output*
On entry: X($1 + j_1 + n_1 j_2 + n_1 n_2 j_3 + \dots$) must contain the real part of the complex data value $z_{j_1 j_2 \dots j_m}$, for $0 \leq j_1 \leq n_1 - 1, 0 \leq j_2 \leq n_2 - 1, \dots$; i.e., the values are stored in consecutive elements of the array according to the Fortran convention for storing multidimensional arrays.
On exit: the real parts of the corresponding elements of the computed transform.
- 6: Y(N) – REAL (KIND=nag_wp) array *Input/Output*
On entry: the imaginary parts of the complex data values, stored in the same way as the real parts in the array X.
On exit: the imaginary parts of the corresponding elements of the computed transform.
- 7: WORK(LWORK) – REAL (KIND=nag_wp) array *Workspace*
8: LWORK – INTEGER *Input*
On entry: the dimension of the array WORK as declared in the (sub)program from which C06FFF is called.
Constraint: LWORK $\geq 3 \times \text{ND}(L)$.
- 9: IFAIL – INTEGER *Input/Output*
On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this argument you should refer to Section 3.4 in How to Use the NAG Library and its Documentation for details.
For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this argument, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**
On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry $IFAIL = 0$ or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

$IFAIL = 1$

On entry, $NDIM < 1$.

$IFAIL = 2$

On entry, $N \neq ND(1) \times ND(2) \times \dots \times ND(NDIM)$.

$IFAIL = 3$

On entry, $L < 1$ or $L > NDIM$.

$IFAIL = 10 \times l + 1$

At least one of the prime factors of $ND(l)$ is greater than 19.

$IFAIL = 10 \times l + 2$

$ND(l)$ has more than 20 prime factors.

$IFAIL = 10 \times l + 3$

On entry, $ND(l) < 1$.

$IFAIL = 10 \times l + 4$

On entry, $LWORK < 3 \times ND(l)$.

$IFAIL = -99$

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.9 in *How to Use the NAG Library and its Documentation* for further information.

$IFAIL = -399$

Your licence key may have expired or may not have been installed correctly.

See Section 3.8 in *How to Use the NAG Library and its Documentation* for further information.

$IFAIL = -999$

Dynamic memory allocation failed.

See Section 3.7 in *How to Use the NAG Library and its Documentation* for further information.

7 Accuracy

Some indication of accuracy can be obtained by performing a subsequent inverse transform and comparing the results with the original sequence (in exact arithmetic they would be identical).

8 Parallelism and Performance

C06FFF is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

C06FFF makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The time taken is approximately proportional to $n \times \log n_l$, but also depends on the factorization of n_l . C06FFF is faster if the only prime factors of n_l are 2, 3 or 5; and fastest of all if n_l is a power of 2.

10 Example

This example reads in a bivariate sequence of complex data values and prints the discrete Fourier transform of the second variable. It then performs an inverse transform and prints the sequence so obtained, which may be compared with the original data values.
