NAG Library Routine Document

F08UNF (ZHBGV)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

F08UNF (ZHBGV) computes all the eigenvalues and, optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form

$$Az = \lambda Bz,$$

where A and B are Hermitian and banded, and B is also positive definite.

2 Specification

```
SUBROUTINE F08UNF (JOBZ, UPLO, N, KA, KB, AB, LDAB, BB, LDBB, W, Z, LDZ,     &
                   WORK, RWORK, INFO)
INTEGER            N, KA, KB, LDAB, LDBB, LDZ, INFO
REAL (KIND=nag_wp)    W(N), RWORK(3*N)
COMPLEX (KIND=nag_wp) AB(LDAB,*), BB(LDBB,*), Z(LDZ,*), WORK(N)
CHARACTER(1)       JOBZ, UPLO
```

The routine may be called by its LAPACK name **zhbgv**.

3 Description

The generalized Hermitian-definite band problem

$$Az = \lambda Bz$$

is first reduced to a standard band Hermitian problem

$$Cx = \lambda x,$$

where C is a Hermitian band matrix, using Wilkinson's modification to Crawford's algorithm (see Crawford (1973) and Wilkinson (1977)). The Hermitian eigenvalue problem is then solved for the eigenvalues and the eigenvectors, if required, which are then backtransformed to the eigenvectors of the original problem.

The eigenvectors are normalized so that the matrix of eigenvectors, Z, satisfies

$$Z^{\mathrm{H}}AZ = \Lambda \quad \text{and} \quad Z^{\mathrm{H}}BZ = I,$$

where Λ is the diagonal matrix whose diagonal elements are the eigenvalues.

5   Arguments

1:    JOBZ – CHARACTER(1)   *Input*

On entry: indicates whether eigenvectors are computed.

JOBZ = 'N'
      Only eigenvalues are computed.

JOBZ = 'V'
      Eigenvalues and eigenvectors are computed.

Constraint: JOBZ = 'N' or 'V'.

2:    UPLO – CHARACTER(1)   *Input*

On entry: if UPLO = 'U', the upper triangles of A and B are stored.

If UPLO = 'L', the lower triangles of A and B are stored.

Constraint: UPLO = 'U' or 'L'.

3:    N – INTEGER   *Input*

On entry: n, the order of the matrices A and B.

Constraint: N $\geq$ 0.

4:    KA – INTEGER   *Input*

On entry: if UPLO = 'U', the number of superdiagonals, k_a, of the matrix A.

If UPLO = 'L', the number of subdiagonals, k_a, of the matrix A.

Constraint: KA $\geq$ 0.

5:    KB – INTEGER   *Input*

On entry: if UPLO = 'U', the number of superdiagonals, k_b, of the matrix B.

If UPLO = 'L', the number of subdiagonals, k_b, of the matrix B.

Constraint: KA $\geq$ KB $\geq$ 0.

6:    AB(LDAB, $*$) – COMPLEX (KIND=nag_wp) array   *Input/Output*

Note: the second dimension of the array AB must be at least $\max(1, \text{N})$.

On entry: the upper or lower triangle of the n by n Hermitian band matrix A.

The matrix is stored in rows 1 to $k_a + 1$, more precisely,

      if UPLO = 'U', the elements of the upper triangle of A within the band must be stored with
      element A_{ij} in AB($k_a + 1 + i - j, j$) for $\max(1, j - k_a) \leq i \leq j$;

      if UPLO = 'L', the elements of the lower triangle of A within the band must be stored with
      element A_{ij} in AB($1 + i - j, j$) for $j \leq i \leq \min(n, j + k_a)$.

On exit: the contents of AB are overwritten.

7:    LDAB – INTEGER   *Input*

On entry: the first dimension of the array AB as declared in the (sub)program from which
F08UNF (ZHBGV) is called.

Constraint: LDAB $\geq$ KA + 1.

8:     BB(LDBB, *) – COMPLEX (KIND=nag_wp) array   *Input/Output*

   Note: the second dimension of the array BB must be at least $\max(1, N)$.

   On entry: the upper or lower triangle of the n by n Hermitian band matrix B.

   The matrix is stored in rows 1 to $k_b + 1$, more precisely,

>   if UPLO = 'U', the elements of the upper triangle of B within the band must be stored with element B_{ij} in $BB(k_b + 1 + i - j, j)$ for $\max(1, j - k_b) \leq i \leq j$;

>   if UPLO = 'L', the elements of the lower triangle of B within the band must be stored with element B_{ij} in $BB(1 + i - j, j)$ for $j \leq i \leq \min(n, j + k_b)$.

   On exit: the factor S from the split Cholesky factorization $B = S^H S$, as returned by F08UTF (ZPBSTF).

9:     LDBB – INTEGER   *Input*

   On entry: the first dimension of the array BB as declared in the (sub)program from which F08UNF (ZHBGV) is called.

   Constraint: $LDBB \geq KB + 1$.

10:    W(N) – REAL (KIND=nag_wp) array   *Output*

   On exit: the eigenvalues in ascending order.

11:    Z(LDZ, *) – COMPLEX (KIND=nag_wp) array   *Output*

   Note: the second dimension of the array Z must be at least $\max(1, N)$ if JOBZ = 'V', and at least 1 otherwise.

   On exit: if JOBZ = 'V', Z contains the matrix Z of eigenvectors, with the ith column of Z holding the eigenvector associated with $W(i)$. The eigenvectors are normalized so that $Z^H B Z = I$.

   If JOBZ = 'N', Z is not referenced.

12:    LDZ – INTEGER   *Input*

   On entry: the first dimension of the array Z as declared in the (sub)program from which F08UNF (ZHBGV) is called.

   Constraints:

>   if JOBZ = 'V', $LDZ \geq \max(1, N)$;
>   otherwise $LDZ \geq 1$.

13:    WORK(N) – COMPLEX (KIND=nag_wp) array   *Workspace*

14:    RWORK($3 \times N$) – REAL (KIND=nag_wp) array   *Workspace*

15:    INFO – INTEGER   *Output*

   On exit: INFO = 0 unless the routine detects an error (see Section 6).

6   Error Indicators and Warnings

INFO < 0

   If INFO $= -i$, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

$\text{INFO} > 0$

If $\text{INFO} = i$ and $i \leq \text{N}$, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero.

If $\text{INFO} = i$ and $i > \text{N}$, if $\text{INFO} = \text{N} + i$, for $1 \leq i \leq \text{N}$, then F08UTF (ZPBSTF) returned $\text{INFO} = i$: B is not positive definite. The factorization of B could not be completed and no eigenvalues or eigenvectors were computed.

7 Accuracy

If B is ill-conditioned with respect to inversion, then the error bounds for the computed eigenvalues and vectors may be large, although when the diagonal elements of B differ widely in magnitude the eigenvalues and eigenvectors may be less sensitive than the condition of B would suggest. See Section 4.10 of Anderson *et al.* (1999) for details of the error bounds.

8 Parallelism and Performance

F08UNF (ZHBGV) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08UNF (ZHBGV) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is proportional to n^3 if $\text{JOBZ} = \text{'V'}$ and, assuming that $n \gg k_a$, is approximately proportional to $n^2 k_a$ otherwise.

The real analogue of this routine is F08UAF (DSBGV).

10 Example

This example finds all the eigenvalues of the generalized band Hermitian eigenproblem $Az = \lambda Bz$, where

$$A = \begin{pmatrix} -1.13 & 1.94 - 2.10i & -1.40 + 0.25i & 0 \\ 1.94 + 2.10i & -1.91 & -0.82 - 0.89i & -0.67 + 0.34i \\ -1.40 - 0.25i & -0.82 + 0.89i & -1.87 & -1.10 - 0.16i \\ 0 & -0.67 - 0.34i & -1.10 + 0.16i & 0.50 \end{pmatrix}$$

and

$$B = \begin{pmatrix} 9.89 & 1.08 - 1.73i & 0 & 0 \\ 1.08 + 1.73i & 1.69 & -0.04 + 0.29i & 0 \\ 0 & -0.04 - 0.29i & 2.65 & -0.33 + 2.24i \\ 0 & 0 & -0.33 - 2.24i & 2.17 \end{pmatrix}.$$
